PRO

NAVIGATOR 2000

General instructions

Read the instructions in this handbook carefully, as they give important information regarding safety during installation, use and maintenance.

Be sure to keep this instruction manual with the FIXTURE, in order to consult it in the future. If the FIXTURE is sold or given to another operator, make certain that it always has its manual, to enable the new owner to read about its operation and relative instructions.

- This FIXTURE is not intended for home use.
- After having removed the packaging, check that the FIXTURE is not damaged in any way. If in doubt, don't use it and contact an authorized Technical Service Centre.
- Packaging material (plastic bags, polystyrene foam, nails, etc.) must not be left within children's reach, as it can be dangerous.
- This FIXTURE must only be operated by adults. Do not allow children to tamper or play with it.
- Electrical work necessary for installing the FIXTURE must be carried out by a qualified electrician or experienced person.
- Never use the FIXTURE under the following conditions:
 - In places subject to excessive humidity
 - In places subject to vibrations or bumps.
 - In places with a temperature of over 45°C or less than 2°C
- Protect the FIXTURE from excessive dryness or humidity (ideal conditions are between 35% and 80%).
- Do not dismantle or modify the FIXTURE.
- Make certain that no inflammable liquids, water or metal objects enter the FIXTURE.
- Should any liquid be spilled on the FIXTURE, disconnect the power supply to the FIXTURE immediately. In the event of serious operating problems, stop using the FIXTURE immediately and either contact the nearest sales point for a check or contact the manufacturer directly.
- Do not open the FIXTURE - there are no user serviceable parts inside.
- Never try to repair the FIXTURE yourself. Repairs by unqualified people could cause damage or faulty operation. Contact your nearest authorized service center

Always insist on original spare parts being fitted.

Safeguard the environment: don't throw batteries, accumulators or packaging material into your waste bin - return them to your reseller or take them to the nearest special waste collection point.

Manual layout

All the parts of this user's manual have been laid out in such a way as to facilitate getting to know the details of the NAVIGATOR 2000 lighting control board.

Each section is presented using the simplest possible terminology, although remaining necessarily technical.

This new universal controller has been designed to ensure the utmost user-friendliness.

Chapters 1 and 2 are deliberately generic and conversational and have the job of presenting the FIXTURE.

On the previous page, the index also gives an initial idea of how explanations of functions and commands are divided, always beginning with the easiest and working up to the most complicated.

We suggest even experienced operators read this manual in its entirety, as it's often possible to appreciate every nuance in the logic of the FIXTURE's design only after completely understanding the

reasoning behind every choice made when designing both hardware and software.

1. NAVIGATOR 2000 layout

1.1 Main Features

's new NAVIGATOR 2000 universal lighting controller is one of the results of our long experience in the manufacture of this type of control equipment, and is able to control 512 channels using DMX 512 protocol, of which a maximum of 192 channels can be set as dimmer channels and the rest reserved for 40 intelligent FIXTUREs using up to a maximum of 36 channels each (the channel limit obviously remains 512).

The quality and design are those the trade has come to expect from YPL and the sophisticated electronics used, combined with ground-breaking performance, places this FIXTURE at the top of the best international products. Careful in-depth study of the functions, an on-going search for innovative materials, technical updating and constant research aimed at even greater safety have led to the realization of this unique product.

This FIXTURE's structure and electronics were entirely designed by our R&D lab, ensuring we have complete command of the know-how and the best possible quality:price ratio.

Like all other YPL products, before being put on the market these boards underwent a lengthy burn-in period, passing the strict tests with brilliant results: further proof of their high quality and reliability.

Great care taken with the lines and optimisation of the external structure to ensure utmost user-friendliness, enable them to be easily installed and facilitate any necessary maintenance work to the utmost.

The NAVIGATOR 2000 is built in compliance with current CE norms.

1.2 Technical Specifications

Power supply	external AL (+12V DC, 2A max.)
Power required	+12VDC, 500mA
Power absorbed	6W
Storage protection	a dipswitch allows programs and/or setup to be protected
Setting	via dipswitches (for RS-232 and MIDI)
Inputs/Outputs	<ul style="list-style-type: none"> - DMX OUT via 3-pin XLR-F connector (*) for serial digital return signal; - 6.3mm. stereo jack for up/down Record change pedal; - 3mm. unbalanced stereo jack for audio IN - 0dB, mono (or left) - DB9 connector for RS-232 serial connection with a personal computer; - 3-pin XLR-F for SMPTE signal input; - Standard 5-pin DIN connector for MIDI IN-THRU-OUT.

DMX channels: 512 (max.) configurable for intelligent FIXTURES and dimmer channels

FIXTURE frame Sheet metal with epoxy powder finish

Dimensions 5u rack 19" (cm 48,2 x 22,2 x 6,5 h max). Peso Kg 3,7

(*) wired for DMX return signal, not operative with this software version.

Elettronica reserves the right to improve or modify their products

at any time without prior notice. Always consult the handbook of the FIXTURE being used to avoid errors

and differences between the actual functions and those shown in the book.

1.2 NAVIGATOR 2000 sections

1.3.1 - Multifunction Keyboard

According to the function selected, this keyboard can be used to recall Memories, Programs, Chases, Mchases, Presets, FIXTURES or SCENES

1.3.2 - Record obj

This section of buttons is used to select the 4 elements that make up the Record Objects (Program, Chase, Mchase and Preset). Once they've been programmed, these elements must be entered in the Memories in order to be run.

1.3.3 - Programming Keyboard

This section comprises all the keys and the functions associated with them, which allow to edit and set the running times and general output levels of the elements that make up the Record Objects.

1.3.4 - Operations

This section is used to access Setup functions, dedicated to the control of the desk's parameters (such as channel patching) and the libraries containing the information regarding intelligent Fixtures. It's also possible to record and play back stored events using the built-in SMPTE signal generator.

1.3.5 - Utility

This section of the NAVIGATOR 2000 makes special functions such as Extra, Lamp e Reset, immediately available: these operate directly on the luminaires (switching the lamp on and off), the intelligent Fixtures (remote Reset) and the controls sent to special FIXTURES such as smoke machines or centrepieces (Extra channels).

1.3.6 - Grand Master

NAVIGATOR 2000 has a general output level control, used to adjust the overall of all the "dimmer" channels, whether they are of the traditional type or of intelligent Fixtures.

The value is shown as a percentage, with a range of 0 - 100%.

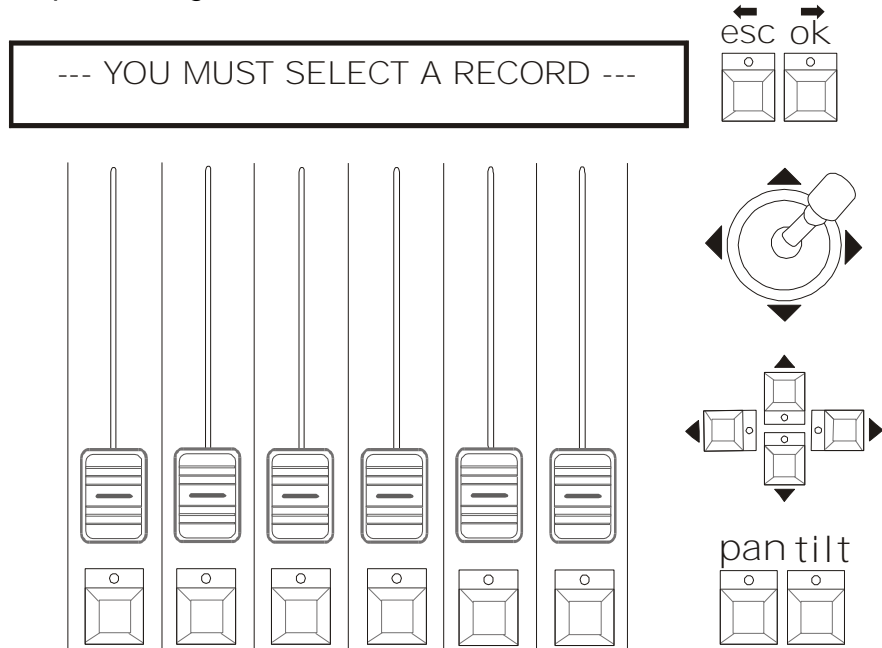

1.3.7 - Universal controls

This section includes the universal controls that are used to control the Fixtures and the entire Pilot itself.

The functions vary according to the operating mode selected on the Programming Keyboard.

Moving head FIXTURE/scanner controls are completed by a joystick (which operates on absolute co-ordinates) and 4 cursor buttons (which operates on relative co-ordinates). The combination of these two systems ensures extremely precise control when positioning Fixtures.

1.4 NAVIGATOR 2000 connectors

1.4.1 - DMX 512

The NAVIGATOR 2000 controller has DMX 512 input/output. At the moment the input isn't enabled by the software. Certified screened DMX512 cables (2x0.25mm) must be used for connections and must be of good quality to avoid faulty equipment operation.

Attention: the cable screen (braid) must NEVER be Connected to the system's ground, as this would cause faulty Fixture or controller operation.

1.4.2 - Pedal up-down

This connector allows a pedal to be connected to the Controller for SCENEping up and down through the memories. Pressing UP and DOWN simultaneously switches the Record off. The Record's enabled by pressing UP (starting from Record 1) or DOWN (starting from Record 40).

1.4.3 – SMPTE

The SMPTE signal enables operators to record series of Events in sync with an SMPTE signal. This ensures absolutely precise sync, ideal for use in musical, television and theatrical applications.

1.4.4 – MIDI

NAVIGATOR 2000 has Midi In, Thru and Out connectors. These offer a considerable amount of functions. See the relative chapter for details.

1.4.5 - RS-232

Using this connector, the desk can be connected to a PC. This offers a considerable amount of functions. See the relative chapter for details.

1.4.6 - Audio in

This socket allows to enable all the controller's music sync functions. When there's no direct connection to an audio source, the built-in microphone is used. A LINE, mono, 0Db signal is required. An alternative is to use the Left-hand channel of a stereo signal.

1

2 - FIXTURE maintenance

2.1 Access to internal components

For access to the Pilot's internal components, the 8 screws on the bottom of the frame must be loosened.

There are no user-serviceable components inside, so it's inadvisable to open the board: only qualified technical personnel can carry out work on the electronic components.

Before disconnecting the power supply, always remember to switch off the board.

2.2 Cleaning and periodical checks

The FIXTURE should be cleaned approximately every 100 hours, using compressed air to remove any accumulated dust. The paint finish allows the board to be cleaned with alcohol or similar products:

in any case, always use a non-abrasive cloth.

Make absolutely certain to avoid damaging the display by pressing too hard. To ensure perfect FIXTURE efficiency, an overall check every 700 running hours is advisable. Electrical and mechanical parts must be checked by qualified technical personnel.

3 - NAVIGATOR 2000 controls

3.1 – Record

NAVIGATOR 2000 is a universal controller able to control both intelligent lighting and dimmers. Although manual control of the FIXTUREs can always be assumed at any point, the utmost can be obtained from the board's performance by exploiting its Memories, powerful groups of controls which work in a similar way to the “macros” used by computers. Each Record is used as a “container” able to hold (simultaneously):

- 4 Programs (intelligent Fixture programs);
- 4 Chases (dimmer channel chases);
- 4 Mchases (assignment of dimmer channel switching to the 4 available audio bands: Low, Mid-Low, Mid-High, High)
- 4 Presets (lighting Scenes created by the dimmer channels).

NAVIGATOR 2000 has 40 Memories, which over-ride each other.

3.1.1 - Mixing Techniques

3.1.1.1 - HTP technique

Dimmer channels are switched on using HTP technique (Highest Takes Precedence): the highest output level "passes". This means that if 2 or more Presets are enabled on the same channel, the channel level will be decided by the higher of the two, according to the following table, in which the values should only be considered as examples:

Preset 1 channel 001 level 50%
Preset 2 channel 001 level 80%
Preset 3 channel 001 level 30%
<u>Preset 4 channel 001 level 0%</u>
Outputs channel 001 level 80%

HTP technique means that (in all cases) the output level never exceeds the highest and the level doesn't correspond to the sum of the 4, which would give a level of 160%: the maximum output level of a preset or a channel can never exceed 100%.

These is also the case for the Chases and Mchases and, obviously, for Chase/Mchase/Preset combinations.

Consequently, if channel 001 is used in the 3 elements, the output level of the channel will be the highest of the 3. Again in this case, it's possible to represent this condition with a table (assuming we observe the output at the instant x):

Preset 1 channel 001 level 50%
Chase 1 channel 001 level 40%
<u>Mchase 1 chabbel 001 level 70%</u>
Outputs channel 001 level 70%

So, in the condition shown here, only the Mchase will be visible, as its level is higher than that of the Chase and Preset.

3.1.1.2 - LTP technique

LTP (Latest Take Precedence) technique is normally used to control the intelligent lighting section. In this way, the "moderator" of the signals in output (which will control moving head fixtures, scanners and anything else) is time: when a FIXTURE is controlled by several Programs (and therefore

by several Memories), only the most recent command will be sent to it. Here again, a table is of assistance:

FIXTURE 1 instant x operation: moving Pan to point 0.0 in 10 sec
FIXTURE 1 instant x+1sec. operation: moving Pan to point 255.0 in 15 sec
<u>FIXTURE 1 instant x+3sec. operation: moving Pan to point 100.100 in 2 sec</u>
Output instant x+3sec. operation: moving Pan to point 100.100 in 2 sec

In this example, if the initial movement requires 10 seconds, there will be a first change at instant x + 1 second which will reach the new co-ordinates in a time of 15 seconds and a final change at the instant x + 3 seconds which will reach the final co-ordinates in 2 seconds.

LTP technique means that the total time of the movement isn't the total of the 3 (27 seconds), but is obtained by summing the last time with the time from the start of the sequence (therefore approximately 6 seconds).

This mixing technique is used with Program and Record.

3.2 – Program

NAVIGATOR 2000 has 40 programs, any 4 of which can run simultaneously.

The use of several simultaneous programs has the obvious limit that a certain controlled FIXTURE (e.g.

a scanner) cannot have one of its effects (e.g. the colour) used simultaneously by several programs: due to LTP mixing technique (see 3.1.1.2) only the last command received would be run, not all of them simultaneously.

Simultaneous use of programs however allows operators to control light shows with the utmost freedom, for example using program 1 for the colourchangers for a backdrop, 2 for the scanners downstage, 3 for moving head Fixtures and 4 for front of house colourchangers.

In permanent installations, this feature can be used (for example) to control the Fixtures in different zones of the venue.

We're certain that all operators will be able to imagine convenient ways of using this control facility.

Each Program contains a maximum of 40 SCENEs (Scenes). To select a Program, first select one of

the 40 Memories available. If a Record isn't enabled, the following appears on the display

--- YOU MUST SELECT A RECORD ---

: .

3.3 – Chase

NAVIGATOR 2000 has 192 channels that can be reserved for control of the dimmer channels. These 192 channels can be animated thanks to Chases, series of on/off commands that can be programmed by the operator.

40 Chases are available, each made up of a maximum of 40 SCENEs.

In each SCENE, it's possible to set:

- the level at which each channel is switched on (from 0 to 100%)
- the length of the SCENE (Time, from 0 to 999 tenths of a second)
- the time taken to pass from one SCENE to the next (Cross, from 0 to 100% of Time).
- general level.
- general timing.

To select a Chase, first select one of the 40 Memories available. If a Record isn't enabled, the following appears:

--- YOU MUST SELECT A RECORD ---

The possibility of setting the cross time from SCENE to SCENE allows to have a chase with clear-cut changes between SCENEs or a "soft" changeover, in which the 'cross' creates a "micro mix" between SCENEs.

If CROSS is set at 100%, this means that it lasts the same amount of time as the TIME of the SCENEs run, cancelling fade-up time and thus obtaining a clear-cut ignition.

3.4 – Mchase

The 192 dimmer channels (see 3.3) can also be used to control Fixtures in time with the music, with the sync linked to 4 different audio bands.

NAVIGATOR 2000 has 40 Mchase set-ups, which can be programmed by the operator. For each of these, it's possible to assign:

- the level of single channels for each audio band.
- the general level.
- input/output time.

To select a Mchase, first select one of the 40 Memories available. If a Record isn't enabled, the following appears:

--- YOU MUST SELECT A RECORD ---

3.5 – Preset

This function also uses the 192 dimmer channels available on the NAVIGATOR 2000, which in this case

are used to create fixed lighting Scenes. There are 40 Presets available, programmable by the operator. For each of these, it's possible to assign:

- the level of each single channel used
- the general level of the entire Preset (Level, from 0 to 100%)
- the fade-up/fade-down times of the entire Preset (Times, from 0 to 999 tenths of a second).

To select a Preset, first select one of the 40 Memories available. If a Record isn't enabled, the following appears:

--- YOU MUST SELECT A RECORD ---

3.6 – FIXTURE

Using this function, available even when no Record is enabled, access is gained to manual control of intelligent Fixtures.

This group of controls is made up of 6 light grey faders, 6 light grey buttons, movement controls and display:

Above each fader, the display indicates the effect it's controlling and the value set. Pressing one of the buttons, control is assigned to the four cursor arrows. When Pan and Tilt are lit, the cursor controls the positioning of the effects Fixtures' mirrors and heads.

The two SCROLL buttons on the right of the display allow to scroll (in groups of 6 at a time) the pages of FIXTURE's effects in group of 6 at a time. The FIXTUREs controlled can have a maximum of 36

channels, 30 for effects, 6 reserved for the moving parts and 2 for the options: each FIXTURE will the-refore have a maximum of 5 pages of effects.

The 6th page contains preset moving effects (only for scanners and moving head Fixtures), which allow to create remarkable effects in a single program: with traditional controllers, this would require dozens of SCENEs cues.

3.6.1 - Groups of FIXTUREs

NAVIGATOR 2000 is able to control 6 groups of FIXTUREs independently of each other and offers the possibi-lity of recalling the groups whenever required.

When  is pressed and held down, the following appears on the display:

```
select other units to make a group
GRP1  GRP2  GRP3  GRP4  GRP5  GRP6
```

The 6 groups are assigned to the 6 light grey universal buttons and only one group can be used at a time. To select the group of FIXTUREs, press the button corresponding to the writing on the display,

then enable the FIXTUREs required, which must all be of the same type. The green LEDs of the FIXTUREs

selected on the Multifunction Keyboard and assigned to a Group flash together and the FIXTUREs'

parameters are shown on the display, for example:

```
IRIS  COLOR  GOBOS  SHUTT  ---  0
  0      0      0      0      ---  0
```

When the FIXTUREs that make up a group have different parameter values, these are replaced by three

```
FUNC
***
```

asterisks on the display. asterisks will be replaced by a numerical value when the effect of all the FIXTUREs reaches the same value. In the event of mixed groups, i.e. those made

up of different types of intelligent Fixtures, the only functions which can be controlled are those regarding the movement of the mobile parts (mirror or moving head) - i.e. the Pan and Tilt channels. Any difference in the running of the movements will depend on the electromechanical characteristics of the relative Fixtures.

3.6.2 - Moving effects

NAVIGATOR 2000 has several pre-programmed moving cues, dedicated to scanners and moving head

Fixtures.

Using these powerful controls, it's possible to create highly effective cues with just one com-mand, and it's also possible to use them when creating programs, with the considerable advanta-ge of preparing a complete moving light effect in just one Scene.

After having selected a FIXTURE (e.g. a scanner), use the right-hand scroll button to reach the page

dedicated to these functions. The following appears on the display:

SHAPE	X_SCL	Y_SCL	SPEED	RUN	ANG	XXX
static	---	---	---	---	---	YYY

The effects available at the moment are Circle, Square, Diagonal 1 (Diag1), Diagonal 2 (Diag2), Corner, Infinity (Inf.ty) and Zigzag.

The parameters which can be changed by the operator are:

X_SCL: scale on the X axis (from 0 to 100%)

Y_SCL: scale on the Y axis (from 0 to 100%)

SPEED: speed at which the effect runs (from 0 to 255)

RUN: direction of movement (normal or reverse)

ANG: starting angle of the effect (from 0° to 359°).

Using the scale and speed parameters, it's possible to deform the initial shape, thus creating others.

When several scanners are used with the same effect, the use of the ANG parameter allows to create spectacular "chase" effects: this value in fact staggers the various Fixtures, which appears as a delay in carrying out the movement.

Some moving light effects give the most spectacular results when the Fixtures used have a regular

or symmetric layout.

3.7 – SCENE

This control is used to select the SCENE to be created or modified in a Program or Chase.

It's only enabled when Edit mode () is enabled along with  or  .
The Edit LED flashes.

3.8 - Page

NAVIGATOR 2000 has 2 pages for Memories, Programs, Chases, Mchases, Presets, FIXTURES and SCENES.

When the button's LED is off () page 1 is enabled (selections from 1 to 20), whereas

when () is lit, page 2 is enabled (selections from 21 to 40).

3.9 – Store

The Hold function allows to store the Elements created in the programs.

Hold also allows to copy the Memories. For example, if it's necessary to copy the contents of Record 1 to Record 2, first select the "source" Record and then, pressing and holding down Hold, select the "target" Record.

3.10 – Edit

This control is used to access the section for creating and modifying the Record Objects (Programs, Chases, Mchases and Presets). When Edit is enabled, the relative LED flashes.

Each function has different operating modes, so the relative sections in this manual must be read for details.

3.11 – Levels

Allows to set the general level of the Record Objects (Programs, Chases, Mchases and Presets). This function operates simultaneously (but individually) on all 4 elements of the Record Objects assignable to a Record and is only enabled for the elements of the Record Objects that have already been selected.

To store the new levels set, press the button  and, keeping it pressed, press the button of the required Record (for example ). As long as  is pressed, the following appears on

--- SELECT DESTINATION MEMORY ---

the display:

3.11.1 - Levels in Preset mode

When , is pressed, the following appears on the display:

PRE04 PRE03 PRE02 PRE01
[255] 0 0 0 levels ok->

“PRE0x” indicates (in chronological order) which Preset has been selected.

To set the new values, use the light grey faders alongside the printing on the display.

Using the cursor buttons, it's possible to change the values and move from one Preset to another of the 4 available.

3.11.2 - Levels in Chase mode

The description in paragraph 3.11.1 is also valid for Chases.

3.11.3 - Levels in Program mode

The description in paragraph 3.11.1 is also valid for Programs.

3.11.4 - Levels in Mchase mode

The description in paragraph 3.11.1 is also valid for Mchases.

3.12 – Times

This function allows to set fade-in and fade-out time for Presets and Chases.

The time can be set between 0 and 999 tenths of a second (600 hundredths of a second correspond to 1 minute).

3.12.1 - Times in Preset mode

In this operating mode, Times allows to set the fade-up time of a Preset (a lighting cue with fixed dimmable luminaires) in the relative Record. The cue's fade-up and fade-down times are the same.

This function operates simultaneously (but individually) on all the 4 Presets assignable to a Record, and is only enabled on Presets that have already been selected.

When , is pressed, the following appears on the display:

```
PRE04 PRE03 PRE02 PRE01
[600] 0 0 0 rise/fall ok->
```

Once the times required have been set, when OK is pressed (right-hand scroll button on the right

of the display): use Hold to store the changes.

3.12.2 - Times in Chase mode

When working in Chase mode, the Times function can be used to set the following for each of the 4 Chases:

- Trigger (TRIG) built-in or musical sync signal (INTRN or MUSIC)
- Direction (RUN) normal or reverse running (NORM or BACKW)
- Speed (SPEED%) running speed (from 25% to 400% of default speed).

When  is pressed, the following appears on the display:

```
CHA TRIG RUN SPEED%
01 [INTRN] NORML 100 ok->
```

To select the Chases, use the Multifunction Keyboard keys. The 4 Chases of the current Record will be indicated by the relative lit LED, the Chase whose Times are being set will have the relative LED flashing. The music sync uses the signal picked up by the built-in microphone or the Audio In connector. When NAVIGATOR 2000 is connected to an audio signal, the built-in microphone is automatically by-passed.

Chases normally run from SCENE 1 to SCENE 40. When a run is set on BACKWARD, it goes from SCENE 40 to SCENE 1.

When creating a Chase, operators can set the duration time of each single SCENE.

By means of the Speed control, it's possible to accelerate up to 400% or slow down to 25% the overall chase running speed, which will otherwise run at a default speed of 100%. The variation is relative to the times set, which will all be subject to the acceleration or deceleration required, but will maintain the characteristic of different SCENE times set when creating the Chase.

3.13 – Copy

NAVIGATOR 2000 has 40 Programs, 40 Chases, 40 Mchases and 40 Presets. The Copy function allows

operators to copy the elements making up the Record Objects, obtaining new elements identical to the original ones.

When Copy is enabled, the relative LED flashes.

According to the current operating mode enabled when the Copy button is pressed, one of the following messages appears on the display:

```
COPY OBJECT FROM TO esc<-
PRG [01]-> 2 ok->
```

if in Preset;

```
COPY OBJECT FROM TO esc<-
CHA [01]-> 2 ok->
```

if in Chase;

```
COPY OBJECT FROM TO esc<-
PSY [01]-> 2 ok->
```

if in Mchase;

if in Preset.

The Up/Down cursor arrows are used to select the elements available, the Left/Right cursor arrows to move from the "source" object to the "target" object.

Press OK (right-hand Scroll button) to confirm the copy, ESC to abort the operation.

There's no "Undo" type of function for restoring the condition before the one confirmed with OK.

3.14 – Enter

The Enter button is used to confirm storage of the new elements that make up the Record Objects or any modification made to them.

3.15 – REC

The Play function allows to run one of the 20 tracks of previously recorded "events". For details, see the relative chapter.

3.16 – Extra

NAVIGATOR 2000 allows to reserve a maximum of 48 channels for particular FIXTUREs or functions.

One classic example is the control of strobe lights, smoke machines and, generally speaking, any FIXTUREs requiring just one DMX channel for their control.

All signal settings and patching must be carried out in the Setup Menu (see 3.19).

When Extra is enabled, the relative LED flashes and on the following appears on the display:

```
EXT01 EXT02 EXT03 EXT04 EXT05 EXT06 <->
[ 0 ]    0      0      0      0      0
```

The right and left-hand SCROLL buttons allow to scroll through the 8 pages dedicated to the 48 "Extra channels". According to the type of FIXTUREs controlled as "Extras", they can be enabled using the faders and the light grey universal buttons.

3.17 – Lamp

By means of this control, it's possible to send Fixtures with this function the code for switching their lamp on and off. When the Pilot is switched on, default status is that the lamp is lit. When Lamp is pressed, the following message appears on the display:

```
SWITCH LAMPS BY HOLDING DOWN KEYS
```

By holding the keys of the Multifunction Keyboard down for a few seconds, it's possible to switch the lamp on or off. When the green LED is lit, this shows that the lamp is lit, when the LED's off, the lamp's off.

It must be remembered that switching the lamp on and off frequently, particularly with Fixtures fitted with discharge lamps, reduces the lamplife, sometimes considerably!

3.18 – Reset

By means of this control, a command for resetting the electronics can be sent to Fixtures with this function. This is a type of direct action which the operator carries out on the FIXTURES controlled.

The following message appears on the display:

```
PUSH UNIT'S KEYS TO SEND RESET
```

By pressing the keys of the Multifunction Keyboard, it's possible to send the command. The green LED lights up for as long as the key is pressed.

3.19 – Setup

This function is used to access the Setup Menu, by means of which the FIXTURES are patched and libraries managed. See chapter 4 for details of this function.

4 - Setup functions

Access is gained to these functions by pressing the

button.

4.1 - FIXTURE Patch

To control the 40 FIXTURES, it's necessary to carry out patching procedure.

When the Menu button flashes, the up/down cursor arrows are used to scroll through the options available until the following screen appears:

```
CONFIGURATION & SETUP MENU
SELECT --> [UNIT PATCH] ok->
```

Pressing the right-hand arrow of the SCROLL buttons gives access to the setting menu:

```
UNIT TYPE          FROM -100 1--cod--10
[ 1] VICTORY 2  <DEL> TO -111 ""|||""||
```

The cursor arrows can be used to assign the parameters (up and down to increase or decrease the values, right and left to move from function to function).

In the above case, FIXTURE 1 is an YPL Victory II 250, whose starting address is set at 100.

NAVIGATOR 2000 automatically calculates the last channel required by that FIXTURE and on the right-hand

side of the display shows the configuration to set on the dipswitch on the rear of the Fixture.

In this case (as conventionally done), the dipswitch's "ON" position is that in which a small square appears at the top.

Pressing the button corresponding to deletes what has been previously set.

The operator isn't obliged to assign the FIXTURES numerically rising patches (for example 100 for number 1 and 125 for 2), but can handle the FIXTURES at his or her disposal as required.

Press one of the SCROLL buttons again to leave this function: storage is automatic.

4.2 - Dimmer Patch

This function allows to set which DMX channels correspond to the "dimmer channels".

When the Menu button flashes, use the up/down cursor arrows to scroll the options available until this screen appears:

```

CONFIGURATION & SETUP MENU
SELECT --> [DIMMER PATCH      ]  ok->

```

For access to these settings, just press the right-hand arrow of the SCROLL buttons (on the right of the display):

```

DMX-CH    CHANNEL    LIM%    EQUAL    ok->
[001] <----    1    100    7    <DEL>

```

“DMX-CH” indicates the “physical” dimmer channel of the DMX chain (from 1 to 512); CHANNEL shows which dimmer channel of the Pilot will control the chosen channel or channels; LIM% indicates any attenuation on that channel and EQUAL the equalization curve assigned to the channel. Pressing the light grey button below the display, corresponding to , the settings made will

4.2.1 - Equalization curves

Use of equalization curves optimizes luminous output when using Fixtures with different types of lamps (e.g. theatrical Fixtures and PAR 64).

There are 6 curves (from 1 to 6), linear output (N° 7) and an On/Off curve (N°8), which has the following reference values:

$$000 \div 127 = \text{off}$$

$$128 \div 255 = \text{on.}$$

4.3 - Extra Patch

This function allows to define the DMX channels corresponding to the “extras”, i.e.

Those FIXTUREs (normally smoke machines or strobe lights) which the operator controls directly (without going through Record and Program).

When the Menu button flashes, use the up/down cursor arrows to scroll through the options available until this screen appears:

```

CONFIGURATION & SETUP MENU
SELECT --> [EXTRA PATCH      ]  ok->

```

To access these settings, just press the right-hand arrow of the SCROLL buttons (on the right of

the display) :

```

EXTRA DMX-CH LABEL KEY EQUAL
[001] ---    EXT01 OR    LIN    <DEL>  ok->

```

- “EXTRA” indicates the Extra channel to be set (from 1 to 48);
- “DMX-CH” indicates the DMX channel (from 1 to 512) which is to be controlled by the Extra function;
- LABEL allows to choose (using just 5 characters) an abbreviation to identify the FIXTURE (e.g. SMK01 could indicate smoke machine number 1);
- KEY indicates the type of function assigned to the light grey universal button;
- EQUAL indicates the equalization curve assigned to the channel.

Pressing the dark grey button below the display, in correspondence to , the settings carried-out will be deleted.

4.3.1 - Extra labels

The operator can replace standard Labels (e.g. EXT01) with a 5-character abbreviation which facilitates identification of the Fixture controlled.

To modify the abbreviation, press the light grey universal button corresponding to EXT01 on the display. The green LED will flash.

Using the cursor arrows (up, down, right and left), the operator can modify the description as required.

To confirm the new Label, press the light grey button again (the LED goes off).

4.3.2 - Extra Key mode

2 modes are available: OR and AND. When the OR mode is set, it's possible to control the Extra FIXTURE can be controlled using the universal fader and using the button as a flash control (flash always has a value of 255). When AND mode is chosen, the Extra FIXTURE is only enabled for as long

as the button is pressed and its output level regulated by the fader.

To change operating mode, just press the light grey universal button (during the setup stage) located in correspondence to the function Key. The new operating mode appears immediately on the display

4.3.3 - Extra equalization curves

By means of this command, the operator can choose one of the 2 curves available: LIN and ON-OFF.

When the Extra being controlled is (for example) a simple smoke machine with just a "start" button, linear regulation (LIN) is useless and sometimes doesn't give good FIXTURE control. For this type

of FIXTURE, there's an On-Off curve, which has a clear-cut threshold ensuring ideal control of the machine.

To change the equalization curve, press the light grey universal button located in correspondence to the Equal. function during the Setup stage. The new curve appears immediately on the display.

4.4 - Total Dimmer Channels

This function allows operators to decide how many DMX channels they want to dedicate to the dimmer channels.

NAVIGATOR 2000 can control up to 192 channels, divided into 32 pages on the display.

It's important that operators set the correct number of channels, as this allows the NAVIGATOR 2000's

CPU to optimize its performance and dedicate more power to the section dedicated to the intelligent FIXTUREs.

When the Menu button flashes, use the up/down cursor arrows to scroll through the options available until the following screen appears:

```

CONFIGURATION & SETUP MENU
SELECT --> [TOTAL DIMMER CHANNELS]  ok-->

```

To access these settings, just press the right-hand arrow of the SCROLL buttons (on the right of

the display):

```

      N.PAGES      CHANNELS      esc<-
      [ 8]         48             ok-->

```

Using the up/down arrows or the fader corresponding to the writing on the display, operators can change the number of pages, and the Pilot will indicate how many channels they correspond to. Pressing OK (right-hand scroll button on the right of the display) confirms this operation, pressing ESC (left-hand scroll button on the left of the display) aborts procedure without modifying.

4.5 - MOVing Area

Operators often have to limit a Fixture's scanning area, for example to illuminate a proscenium without lighting the front row of the stalls, or to adapt stored programs to stage situations, which often change.

With a view to this, NAVIGATOR 2000 allows to control the 20 different scanning areas for each Fixture

(obviously only scanners and moving head FIXTUREs) which operators have at their disposal.

When the Menu button flashes, use the Up/Down cursor arrows to scroll through the options until the following screen appears:

```

      CONFIGURATION & SETUP MENU
SELECT --> [WORKING AREA      ] ok->

```

For access to these settings, just press the right-hand arrow of the SCROLL buttons (on the right

of the display):

```

----- set working area -----
  L      J      7      n  TEST  SET 1  ---

```

The LED lights up simultaneously: this shows operators that they have to choose the FIXTURE

whose working area has to be modified.

To assign one of the available scanning areas, scroll with the fader under the "SET 1", until the required area is reached. To check if the area meets requirements, the light grey button corresponding to "TEST" is pressed (the message flashes) and the scanning area "tested" by moving the joystick.

To modify the scanning area, press the light grey button under the 4 small corner symbols (Ô, ¾, ¼, Ö) then move the joystick to the required new corner. When the ideal position is reached, the new corner is stored by pressing the button again.

Operating areas can be created as required, without being obliged to form regular shapes, as shown in this design.

There's no command for resetting a operating area once it's been set, but to do so the 4 corners are selected and the co-ordinates shown in the design alongside entered: 0.0 - 999.0 - 999.999 - 0.999.

Reducing the scanning area of a Fixture also considerably improves the precision of moving parts, whether they're mirrors or heads. In fact, reducing the scanning area doesn't reduce the number of SCENEs for positioning, which remains unchanged (255 for 8-bit Fixtures and 65.536 for 16-bit Fixtures). If the Fixtures being controlled don't have commands for automatic inversion of scanning

co-ordinates, (to facilitate positioning Fixtures mounted opposite each other), the scanning areas allow to solve the problem by simply crossing over the corner values (e.g. setting corner 0.0 as 999.0 and vice versa).

4.6 - View Free Memory

This function allows to check how much Record is available for adding FIXTUREs to the library (DATA

MEM) and how much for recording events (Memory).

When the Menus button Menu flashes, use the up/down cursor arrows to scroll through the options available until this screen appears:

```

      CONFIGURATION & SETUP MENU
SELECT --> [VIEW FREE MEMORY  ] ok->

```

To access these settings, just press the right-hand arrow of the SCROLL buttons (on the right of

the display):

```

FREE MEMORY (bytes):
RECORD:  98304  DATA MEM: 225370  ok->

```

This function is left by pressing OK again.

4.7 – FIXTURE Library

This menu, made up of 3 sections, is a fundamental part of the NAVIGATOR 2000's "brain": this is where

the FIXTUREs to be controlled are created, modified or cancelled from the internal Record.

When the Menu button flashes, use the up/down cursor arrows to scroll through the options available until this menu appears:

```

      CONFIGURATION & SETUP MENU
SELECT --> [INTERNAL LIBRARY      ] ok->

```

To access these settings, just press the right-hand arrow of the SCROLL buttons (on the right of the display).

4.7.1 - Create New FIXTURE

Operators can use this function to enter any FIXTUREs the library doesn't already contain.

ATTENTION! Before proceeding with the creation of a new FIXTURE, make certain to have all the necessary information regarding the FIXTUREs or better still, its instruction manual with all the spec. tables.

Now, proceeding SCENE by SCENE and entering the required parameters, a new FIXTURE can be ready for

use in just a few minutes. The initial menu is the following:

```

--- INTERNAL LIBRARY CONFIGURATION ---
Select ITEM --- [CREATE NEW UNIT   ]

```

Access is gained to the library by pressing the right-hand SCROLL button.

N.B. To simplify menu examples, we shall create an YPL Victory II 250 as a new Fixture.

4.7.1.1 - Total DMX Channel

This information allows the Pilot to know how many channels new FIXTUREs use. As already seen, the

maximum number possible is 36 channels, of which 6 are reserved for movement and auxiliary functions. The menu is the following:

```

Select feature to configure for      esc<-
NNNNNNNNNNNNNNNN--[TOTAL DMX CHANNEL] ok->

```

Pressing the right-hand arrow gives access to setting and pressing the left-hand button, the function is left. The display

```

Total channels occupied on dmx      esc<-
NNNNNNNNNNNNNNNN--[12]             ok->

```

will show. Using CURSOR up/down arrows, operators can increase the number of channels required for the new FIXTURE. The

choice is confirmed by pressing the right-hand SCROLL.

4.7.1.2 - LCD Effect Label

This menu allows descriptions of the commands required by the new FIXTURE to be written on the

LCD. The menu is the following

```

Select feature to configure for      esc<-
NNNNNNNNNNNNNNNN--[LCD EFFECT LABEL] ok->

```

Pressing the right-hand arrow gives access to setting and pressing the left-hand button, the function is left. The display

will show

```
Enter number of lcd pages      esc<-
NNNNNNNNNNNNNNNNNNNNNNNNNN  [2]  ok->
```

Using the CURSOR up/down arrows (or the right-hand fader of the row under the display), the operator can increase the number of pages required to view all the FIXTURE's effects on the display. Continuing with our example (the Victory II 250), 2 pages are required: the FIXTURE in fact has 12 channels, 4 of which are reserved for Pan and Tilt and 1 for Remote Reset, so 7 remain for the effects, which will be divided by 6 (the effects which can be allocated to each menu), thus obtaining a result of 2 pages. OK (the right-hand SCROLL button) confirms, after which it's possible to create the menus:

```
Enter the string for effects    more<->
----- P1
```

The up/down CURSOR arrows are used to scroll through the set of characters available, left/right to pass from letter to letter, pressing the right-hand SCROLL gives access to page 2 and the left-hand SCROLL returns to the previous menu.

```
Enter the string for effects    more<->
DIMMR COLOR PALET GOBOS ROT.G SHUTR P1
```

In this case: and then

```
Enter the string for effects    more<->
PRISM ----- P2
```

Press the left-hand SCROLL to return to the creation menu now. Storage is automatic.

4.7.1.3 - Softpatch

This part of the instructions regards patching functions to Fixtures' physical channels. When carrying out internal patching, the operator has to set the channel relative to the functions, so effects can be used as required. The menu is the following:

```
Select feature to configure for  esc<-
NNNNNNNNNNNNNNNNNNNNNNNNNNNN [INTERNAL PATCH]  ok->
```

Pressing the right-hand arrow gives access to setting and pressing the left-hand button the function is left.

Once OK (right-hand SCROLL button) has been pressed, the effect string created in 4.7.1.2 will reappear: the following menu appears:

```
DIMMR COLOR PALET GOBOS ROT.G SHUTR <->
[ 1]  --  --  --  --  --  P1
```

Use the CURSOR up/down arrows to set the value, left/right to pass from effect to effect, press the right-hand SCROLL to go to page 2 and the left-hand SCROLL to return to the previous menu.

In this case:

```
DIMMR COLOR PALET GOBOS ROT.G SHUTR <->
[ 1]  2  8  3  7  4  P1
```

and then

```
PRISM ----- <->
[ 9]  --  --  --  --  --  P2
```

Press the left-hand SCROLL to return to the creation menu now. Storage is automatic..

4.7.1.4 - Stand-by Values

This menu is used to set the parameters that must be sent to Fixtures when they're not involved in a Scene or used manually.

It's very important to set these values, particularly when working with Fixtures fitted with discharge lamps, whose shutters have to be closed to avoid light spill, or those with halogen lamps, for which, as well as closing the shutter, output can be lowered by dimming the light. The menu is the following:

```
Select feature to configure for      esc<-
NNNNNNNNNNNNNN--[STAND-BY VALUES]  ok->
```

. Press the right-hand arrow to access setting and the left-hand button to leave the function.

Once OK (right-hand SCROLL) has been pressed, the effect string created in 4.7.1.2 will reappear:

the following menu appears:

```
DIMMR COLOR PALET GOBOS ROT.G SHUTR  <->
[  -]  --    --    --    --    --    P1
```

. Use the CURSOR up/down arrows to set the value, left/right to pass from effect to effect, press the right-hand SCROLL to go to page 2 and the left-hand SCROLL to return to the previous menu.

In this case:

```
DIMMR COLOR PALET GOBOS ROT.G SHUTR  <->
[000]  ---    ---    ---    ---    000  P1
```

in this case and them

```
PRISM ----- <->
[---]  ---    ---    ---    ---    ---  P2
```

These settings therefore indicate that when the scanner is not being used the dimmer must be at 0 and the shutter closed.

Press the dark grey button corresponding to the string on the display: it's possible to set an unvaried

condition (i.e. the last value remains), corresponding to three dashes (---).

Press the left-hand SCROLL to return to the creation menu now. Storage is automatic.

4.7.1.5 - Type of effects

This menu is used to decide which of the new Fixture's functions are effects and which are dimmers. Dimmer functions will always be subject to the action of the fader: this allows a program to "come up" gradually, along with the other luminaires controlled by the desk. The screen is the following:

```
Select feature to configure for      esc<-
NNNNNNNNNNNNNN--[EFFECT TYPE]      ok->
```

. Press the right-hand arrow to access setting and the left-hand button to leave the function. Once OK (right-hand SCROLL) has been pressed, the effect string created in 4.7.1.2 reappears and the following menu appears:

```
DIMMR COLOR PALET GOBOS ROT.G SHUTR  <->
[EFF]  EFF  EFF  EFF  EFF  EFF  P1
```

. Utilizzando le frecce

CURUse the CURSOR up/down arrows to set the value, left/right to pass from effect to effect, press the right-hand SCROLL to go to page 2 and the left-hand SCROLL to return to the previous menu

```
DIMMR COLOR PALET GOBOS ROT.G SHUTR  <->
[DIM]  EFF  EFF  EFF  EFF  EFF  P1
```

In this case: and

```
PRISM ----- <->
[EFF]  ---    ---    ---    ---    ---  P2
```

then .

These settings therefore indicate when the channel of the dimmer function must be considered as such (DIM) and when it must be considered as an effect (EFF).

Press the left-hand SCROLL to return to the creation menu now. Storage is automatic.

4.7.1.6 - Mirror/Head Patch

This menu is used to set the channels dedicated to the movement of mirrors and moving heads. Numerous Fixtures allow both 8 and 16 bit control, others only 8-bit. As already said in previous chapters, 16-bit movement gives a better quality movement. However, since DMX standard requires that each channel is assigned with a value of between 0 and 255, two channels (operating together) are required for the higher resolution, so the value range is between 0 and 65,536.

In 16-bit mode, the two channels (e.g. those for Pan) will have two special functions, called Least Significant Byte (LSB, L or Fine) and Most Significant Byte (MSB, H or Coarse).

In 8-bit mode, just one channel is used (e.g. that of the Pan), so only the MSB (H) parameter is set, leaving the LSB indeterminate (---).

Remember to check if the Fixture to be controlled is operating in 8 or 16 bit mode!

The following menu appears:

```
Select feature to configure for      esc<-
NNNNNNNNNNNNNN--[MIRROR/HEAD PATCH ] ok->
```

Press the right-hand arrow to access setting and the left-hand button to leave the function: the following appears on the

```
display
X(PAN)      | Y(TILT)      | MIRROR/HEAD
H[---]L --  | H -- L --  | OUTPUT      ok->
```

Use the CURSOR up/down arrows to set the value, left/right to pass from parameter to parameter and the right-hand SCROLL to return to the previous menu.

```

X(PAN)      | Y(TILT)      | MIRROR/HEAD
H[ 5]L 11   | H  6 L 12   | OUTPUT      ok->
```

In this case use the Victory in 16-bit mode (advisable),

```

X(PAN)      | Y(TILT)      | MIRROR/HEAD
H[ 5]L --   | H  6 L --   | OUTPUT      ok->
```

or if it's to be used in 8-bit mode.

Press OK (right-hand SCROLL) to return to the previous menu.

4.7.1.7 - Hard/Soft Cross

This menu is used to set the speed at which the Fixture passes from one effect to another. This "run" can be HARD, i.e. taking place at the highest possible speed, or SOFT, i.e. according to the time set with Time (i.e. the changeover from one effect to another). The following menu appears:

```
Select feature to configure for      esc<-
NNNNNNNNNNNNNN--[HARD/SOFT CROSS  ] ok->
```

Press the right-hand arrow to access setting and the left-hand button to leave the function.

Once OK (right-hand SCROLL) has been pressed, the effect string created in 8.5.1.2 reappears: the following menu appears:

```
DIMMR COLOR PALET GOBOS ROT.G SHUTR  <->
[HARD] HARD  HARD  HARD  HARD  HARD  P1
```

Use the CURSOR up/down arrows to set the value, left/right to pass from effect to effect, press the right-hand SCROLL to go to page 2 and left-hand SCROLL to return to the previous menu.

```
DIMMR COLOR PALET GOBOS ROT.G SHUTR  <->
[SOFT] SOFT HARD  SOFT  SOFT  HARD  P1
```

In this case: and then

```

PRISM -----<->
[HARD] -----P2

```

These settings therefore indicate that the channel of the dimmer function, the gobos and their rotation and the prism and its rotation must operate in SOFT mode, whereas the colourchanger and shutter operate in HARD mode.

Press the left-hand SCROLL to return to the creation menu now. Storage is automatic.

The operator can have two versions of the same Fixture in the library, one with SOFT settings (more suited to live applications) and the other HARD (better for clubs).

4.7.1.8 - FIXTURE Name

This menu is used to name new FIXTUREs: operators have a complete set of upper and lower case

characters and symbols at their disposal for this purpose.

The following menu appears:

```

Select feature to configure for      esc<-
NNNNNNNNNNNNNN--[UNIT NAME        ] ok->

```

Press the right-hand arrow to access setting and the left-hand button to leave the function. The following menu appears:

```

INSERT/MODIFY THE NAME OF THE UNIT:
-NNNNNNNNNNNNNN-

```

Use the CURSOR up/down arrows (and the right-hand fader under the display) to choose the letters, left/right to pass from letter to letter and press the left-hand SCROLL to return to the previous menu.

```

INSERT/MODIFY THE NAME OF THE UNIT:
-VICTORY2 TST-

```

In this case:

4.7.1.9 - Reset/Lamp Values

This menu is used to set the parameters which allow the Fixture to carry out Remote Reset and Remote lamp on/off if it has this Fixture.

These settings will be used for the Reset and Lamp functions.

The following menu appears:

```

Select feature to configure for      esc<-
VICTORY TST --[RESET/LAMP VALUES ] ok->

```

Press the right-hand arrow to access setting and the left-hand button to leave the function.

Once OK (right-hand SCROLL) has been pressed, the following menu appears:

```

RESET  OFF  ON  |  LAMP  OFF  ON
[--]  ---  ---  |  --  ---  ---  ok->

```

Use the CURSOR up/down arrows to set the value and the right-hand SCROLL to confirm the choice and return to the previous menu.

```

RESET  OFF  ON  |  LAMP  OFF  ON
[10]  000  255  |  --  ---  ---  ok->

```

In this case:

These settings therefore indicate that the Remote Reset channel operates on channel 10.

Press the right-hand SCROLL to return to the creation menu now. Storage is automatic.

4.7.1.10 - Dip-switch Configuration

This menu is used to enter the data that allow the Pilot to show the exact configuration of the

dipswitch for patching the FIXTUREs during FIXTURE assignment procedure (see 4.1). If the new FIXTURE does not have a dipswitch section, but a built-in microcomputer, these settings can be omitted. The following menu appears:

```
Select feature to configure for      esc<-
VICTORY TST --[DIP-SWITCH CONFIG.]  ok->
```

Press the right-hand arrow to access setting and the left-hand one to leave the function. Once OK (right-hand SCROLL) has been pressed, the following menu appears:

```
ENTER THE DIP-SWITCH CONFIGURATION
n.dip=[ 9]  1st channel= 0  ok->
```

Use the CURSOR up/down arrows to set the value, the left and right-hand ones to pass from parameter to parameter and the right-hand SCROLL to confirm the choice and return to the previous page.

The number of switches (n.dip) which make up the dipswitch section indicates which type of component the Fixture's manufacturer has used. The "1st channel" message is used to set the method used by the manufacturer to enter the address. The dipswitch enters addresses in binary

logic, summing all the values shown by the switches set at ON:

There are two ways of using this addressing system: the first uses a pure binary system, whereas the second automatically adds a 1 to the address. We shall therefore indicate if the 1st Channel has a value of 1 or 0. Addressing changes according to the two examples in

fig. 1 (pure binary) and fig. 2 (1+ binary): . Both systems are used by manufacturers throughout the world and in practical terms, differ in the fact that in the pure binary system the address has a value of 1 if the switch is at ON, whereas in the "1+binary" mode, the address has a value of 1 if all the switches are at OFF. YPL uses the "1 + binary" system, i.e. with a 0 base.

4.7.1.11 - Beam Find Value

This menu is used by operators to set new FIXTUREs' control channels' conditions for use when carrying out the procedure for defining the scanning area. Many scanners and moving head fixtures are fitted with diaphragms or systems for reducing the dimension of the output beam and these can be used to advantage for the best definition of the Fixtures' operating areas.

The following menu appears:

```
Select feature to configure for      esc<-
VICT II TST--[BEAM FIND VALUES  ]  ok->
```

. Press the right-hand arrow to access setting and the left-hand one to leave the function. Once OK (right-hand SCROLL) has been pressed, the effect string created in 4.7.1.2 will reappear: the following menu appears:

```
DIMMR COLOR PALET GOBOS ROT.G SHUTR  <->
[ -]  --  --  --  --  --  P1
```

. Use the CURSOR up/down arrows to set the value, left/right to pass from effect to effect, press the right-hand SCROLL to go to page 2 and the left-hand SCROLL to return to the previous menu. In this case:

```
DIMMR COLOR PALET GOBOS ROT.G SHUTR  <->
[255] 000  000  135  000  255  P1
```

and

```
PRISM ----- <->
[000] --- --- --- --- --- P2
```

then

These settings therefore indicate that in "beam find" status we want the light to be 100%, with gobo 6 (small circle) and the shutter open.

Press the left-hand SCROLL to return to the creation menu now. Storage is automatic.

4.7.1.12 - Control Type

This menu is used to choose one of the two options available for using Fixtures' effects. Many models on the market have continuous colour and gobo wheel rotation (analog functions), which enables operators to obtain interesting projection effects, but during programming, it's often more important to be able to latch a certain colour or effect immediately.

The types of control available are Linear (LIN) and Tabular (TAB): the former enables to scroll through the parameters using the programmed fader, the latter also assigns the up/down CURSOR buttons the direct passage to the "centre value" of an effect. This means that if a certain gobo is projected using values 120 to 139, 132 can be entered to recall it. The use of the tables requires more Record when adding new FIXTUREs to the library (see parag. 4.7.1.2). The following menu appears:

```
Select feature to configure for      esc<-
NNNNNNNNNNNNNN--[CONTROL TYPE      ]  ok->
```

. Press the right-hand arrow to access setting and the left-hand one to leave the function.

Once OK (right-hand SCROLL) has been pressed, the effect string created in 4.7.1.2 will reappear: the following menu appears:

```
DIMMR COLOR PALET GOBOS ROT.G SHUTR  <->
[LIN] LIN  LIN  LIN  LIN  LIN  P1
```

. Use the CURSOR up/down arrows to set the value, left/right to pass from effect to effect, press the right-hand SCROLL to go to page 2 and the left-hand SCROLL to return to the previous menu. In this case:

```
DIMMR COLOR PALET GOBOS ROT.G SHUTR  <->
[LIN] LIN  LIN  TAB  LIN  LIN  P1
```

and

```
PRISM ----- <->
[LIN] --- --- --- --- --- P2
```

then

These settings therefore indicate that tabular control will only be used for the gobo channel.

To set the tables' parameter, press the light grey button below where GOBOS is printed. The following will appear on the display:

PAGE 1	TOT.ITEM	ITEM	VALUE
EFFECT_4	[1]	1	0 ok->

TO.ITEM is intended as the number of parameters to be entered in the table (maximum 50). Press the right-hand CURSOR button to decide which INDEX to change and then the VALUE to enter for that index.

Continuing with the example of the Victory II 250, the following appears:

PAGE 1	TOT.ITEM	ITEM	VALUE
EFFECT_4	[13]	1	0 ok->

PAGE 1	TOT.ITEM	ITEM	VALUE
EFFECT_4	[13]	2	25 ok->

PAGE 1	TOT.ITEM	ITEM	VALUE
EFFECT_4	[13]	3	45 ok->

PAGE 1	TOT.ITEM	ITEM	VALUE
EFFECT_4	[13]	4	65 ok->

PAGE 1	TOT.ITEM	ITEM	VALUE
EFFECT_4	[13]	5	85 ok->

PAGE 1	TOT.ITEM	ITEM	VALUE
EFFECT_4	[13]	6	105 ok->

PAGE 1	TOT.ITEM	ITEM	VALUE
EFFECT_4	[13]	7	125 ok->

PAGE 1	TOT.ITEM	ITEM	VALUE
EFFECT_4	[13]	8	145 ok->

PAGE 1	TOT.ITEM	ITEM	VALUE
EFFECT_4	[13]	9	165 ok->

PAGE 1	TOT.ITEM	ITEM	VALUE
EFFECT_4	[13]	10	180 ok->

PAGE 1	TOT.ITEM	ITEM	VALUE
EFFECT_4	[13]	11	198 ok->

PAGE 1	TOT.ITEM	ITEM	VALUE
EFFECT_4	[13]	12	218 ok->

PAGE 1	TOT.ITEM	ITEM	VALUE
EFFECT_4	[13]	13	255 ok->

Press the right-hand SCROLL button to return to the previous menu. Storage is automatic.

Press the left-hand SCROLL button to leave this menu and return to programming.

4.8 - Error messages

If the procedure for creating a new Fixture is carried out successfully, no particular message will appear on the display and operators can continue patching work and use of the new Fixture. If any mistakes are made or any SCENEs forgotten when creating new FIXTUREs, the display will show a mes-sage like this:

```
CONFIGURATION MISHMASH!      retry<-
Do you want to exit or retry ?  exit->
```

Press the right-hand SCROLL button to see all the parameters again and correct any wrong data: press the left-hand button to abort the session for creating the new FIXTURE, obviously losing all the work done up until then.

When changes are made to a FIXTURE that already exists, the following appears on the display:

```
UNITA X      -ALREADY EXISTS !      quit<-
Do you want to replace it ?  <no> yes->
```

Press YES to confirm the modification to the existing FIXTURE, NO (the light grey button corresponding to the message) to return to the main menu and QUIT to return to parameter modification procedure.

When all available storage space has been used and the operator tries to add new FIXTUREs, the following appears:

```
THERE IS NOT ENOUGH SPACE IN RAM !
                                         ok->
```

È possibile liberare memo
Storage space can be freed by eliminating unused FIXTUREs (see 4.6). Pressing OK switches off the error message.

Different use of the Record for "Event Recording" (chapter 10) doesn't indicate the lack of space with a message: in this case, recording stops automatically (see 10.2).

When operators selects more than 4 elements of the same type of Record Objects which make up a Record (4 Programs + 4 Chases + 4 Mchases + 4 Presets), the following message appears on the display:

```
WARNING: Maximum of four elements!
                                         ok->
```

In this case, the Pilot blocks all the Editing procedure and the OK button (right-hand Scroll button) must be pressed to continue.

4.9 - Modifying a FIXTURE in the library

This option allows operators to modify the parameters of FIXTUREs already in the library.

This procedure is carried out as explained in parag. 4.7.1 and sub-paragraphs.

Any messages that may appear on the display have already been described in parag. 4.8.

The function is accessed from the following menu:

```
--- INTERNAL LIBRARY CONFIGURATION ---
Select ITEM --- [EDIT EXISTING UNIT ]
```

Press the right-hand SCROLL button key to access the function.

4.10 - Deleting a FIXTURE from the library

This option allows operators to delete obsolete or unused FIXTUREs from the NAVIGATOR 2000's library. This

procedure is necessary when there is insufficient space to add new FIXTUREs. The function is accessed from the following menu:

```
--- INTERNAL LIBRARY CONFIGURATION ---
Select ITEM --- [DELETE UNIT ]
```

Press the SCROLL buttons' right-hand key to access the function:

```
Select unit to erase from library  esc<-
          [UNITA X]                ok->
```

Press ESC (left-hand SCROLL button) to leave the cancel function or OK (right-hand button) to eliminate the Fixture.

5 - Creating and modifying elements in the Memories

This section of the manual describes the procedure for creating the elements that make up the Record Objects: Program, Chase, Mchase e Preset.

5.1 - Creating a Program

To illustrate the following examples, operators will have patched the FIXTUREs from 1 to 5 setting them as YPL Victory II 250 scanners (starting addresses 200, 225, 250, 275, 300). For patching options, see chapter 4.1.

As already anticipated, each Record contains a maximum of 4 Program, able to work simultaneously and it's not possible to create or modify a Program without first having selected the Record it belongs to.

A total of 40 Programs are available, so it must always be remembered that carrying out a modification in a Program used by several Memories is equivalent to modifying all the Memories that contain it.

When the button is pressed, the following message appears:

```
---- SELECT PROGRAMS ----
```

To create or modify a Program, press the relative key on the Multifunction

Keyboard (for example), then press to enter editing mode.

When several Programs are selected (max. 4), the flashing LED indicates which is being created

or modified (). The program is indicated on the display, followed by its length.

This is initially indeterminate and indicated by two dashes "--":

```
PROG LENGTH          esc<-
01  [--]             edit->
```

To continue creating a Program, press the right-hand scroll button (Edit).

Press the left-hand button to abort Program creation/modification.

Once Edit is confirmed, the first operation to be carried out is to select the FIXTUREs that will be operative in the Program.

Once the required Program has been completed, return to the menu

```
PROG LENGTH          esc<-
01  [--]             edit->
```

and enter the Length of the Program: if it has 10 SCENEs, the following will be set

PROG LENGTH	esc<-
01 [10]	edit->

After leaving the Program's functions, the following appears on the display

PRG 01 will be UPDATED !	back<-
Press ENTER to store	<ESC>

Pressing the button, the variations carried out will be stored definitively, press the light grey universal button in correspondence to ESC on the display to abort Edit without modifying the Program, press Back (Left-hand scroll) to return to the Editing phase.

5.1.1 - Selecting FIXTURES/Effects

It must be remembered that a FIXTURE (or its effects) cannot be used by 2 or more Programs simultaneously because of the board's LTP mixing technique (chap. 3.1.1.1)!

For this reason, the first operation is to decide which FIXTUREs and effects are to be used in the Program. Scrolling with the up/down cursor arrows, the following appears on the display:

EDIT MENU	esc<-
[ACTIVE EFFECTS]	ok->

Pressing OK (right-hand Scroll button) gives access to the menu used to choose FIXTUREs/effects.

fixture

The button's red LED flashes and the green LEDs of the keys corresponding to the enabled FIXTUREs which were previously patched (see 4.1) light up on the Multifunction Keyboard:

It's now possible to enable or disable the FIXTUREs: the enabled ones (with the LED lit) will be used by the Program, those which are disabled (LED off) will be ignored.

Among the enabled FIXTUREs, the one whose LED is flashing is selected to have effects enabled (which will be shown on the display):

DIMMR COLOR GOBOS SHUTT ROTGB FROST
select active units/effects

The buttons of the effects of the FIXTURE selected will be enabled when the LEDs of the universal buttons corresponding to the indications on the display are lit. In this function, Pan and Tilt can also

be enabled or not. It must always be remembered that there may be effects on the following pages: in this case (pressing the right-hand Scroll button):

PRISM
select active units/effects

The selection of the effects to enable is carried out for every FIXTURE enabled in the Program. Once this procedure is finished, press the left-hand scroll button to return to the Edit Menu.

5.1.2 - Editing SCENEs

In this section, it's possible to create or modify the SCENEs (Scenes) which make up the Program.

Scrolling with the up/down cursor arrows, the following appears on the display:

```

          EDIT MENU
[EDIT STEPS      ]
          esc<-
          ok->

```

. Pressing OK (right-hand Scroll button) gives access to the menu for creating or modifying the SCENEs.

The button's red LED flashes and the green LEDs of the keys corresponding to the enabled FIXTUREs which were previously patched (see 4.1) and for which the effects to be used have

been enabled light up on the Multifunction Keyboard: it's now possible to set the FIXTUREs as required.

Among the enabled FIXTUREs, the one with the flashing LED is selected to have its effects enabled (as shown on the display):

```

DIMMR COLOR GOBOS SHUTT ROTGB FROST | 0
0|    0|    0|    0|    0|    0| | 0

```

. By means of the universal faders, the commands can be sent to the effects of the selected FIXTUREs, which can be controlled individually or in Groups of FIXTUREs (see Chapter 3.6.1).

When the button is pressed and held down, the Multifunction Keyboard is used to select the SCENE to be created or modified.

The button allows to store the new SCENE and make a copy in another SCENE. When the button is pressed, the following appears on the display:

```

select destination step

```

. The operator can then store (pressing the button of the current SCENE) or copy the SCENE (pressing the button of the new SCENE).

Proceed in this way for each SCENE required.

When this procedure is finished, press the left-hand scroll button to return to the Edit Menu.

5.1.3 - SCENE Time

This menu is used to set the running time for each SCENE in a Program. Scrolling with the up/down cursor arrows, the following appears on the display:

```

          EDIT MENU
[STEP'S TIME    ]
          esc<-
          ok->

```

. Press OK (right-hand Scroll button) for access to the menu for setting the times.

The following appears on the display:

```

PROG  STEP CROSS%  TIME
- 1-  [ 1]   50   20

```

Here operators can set each SCENE's duration time (Time) and running time

(Cross%), expressed as a percentage variation of the Time.

If it's necessary to set several SCENEs simultaneously with the same parameters, GROUP OF SCENES

can be used: pressing  and holding it down, the following appears on the display:

```
select other steps to make a group
- 1- [ 1] 50 20
```

, then pressing the

Multifunction Keyboard keys of the SCENEs required (for example   ), the following

appears on the display:

```
PROG STEP CROSS% TIME      ok->
- 1-  [GR]  ***    ***
```

The three asterisks show that the operator has selected SCENEs with different values which will be replaced whenever the corresponding universal fader is moved.

5.2 - Creating a Chase

As already mentioned (see 3.3), NAVIGATOR 2000 has 40 Chases, each with a maximum of 40 SCENEs.

As with the Programs, it must always be remembered that modifying a Chase used by several Memories is equivalent to modifying all the Memories that contain it.

After having pressed the  button, the following message appears on the display

```
--- SELECT CHASES ---
```

To create or modify a Chase, press the relative key on the Multifunction

Keyboard (for example ). then press  to access editing mode.

When several chases are selected (max. 4), the flashing LED indicates which is being created or

modified (). The program is indicated on the display, followed by its length.

This is initially indeterminate and indicated by two dashes "--":

```
CHASE LENGTH      esc<-
01  [--]          edit->
```

To proceed with creation of the Chase, press the right-hand Scroll button (Edit).

Pressing the left-hand button aborts creation/modification.

Once the required Chase has been completed, go back to the menu

```
CHASE LENGTH      esc<-
01  [--]          edit->
```

and enter the chase's length: if it has 15 SCENEs, the setting is

```

CHASE LENGTH          esc<-
01  [15]              edit->

```

After Chase functions have been left, the following appears

```

CHA 01 will be UPDATED !    back<-
Press ENTER to store        <ESC>

```

Pressing the button, the changes made will be stored definitively, pressing the light grey universal button corresponding to ESC on the display, Edit is aborted without modifying the Chase, pressing Back (left-hand scroll) returns to the Edit stage.

5.2.1 - Editing SCENES

In this section, it's possible to create or modify the SCENES (Scenes) which make up the Chase Scrolling with the up/down cursor arrows, the following appears on the display:

```

                EDIT MENU          esc<-
            [EDIT STEPS          ]    ok->

```

Pressing OK (right-hand Scroll button) gives access to the menu for creating or modifying the SCENES.

The button's red LED flashes and the green LEDs of the buttons corresponding to the

SCENE being created/modified:

The level of each dimmer channel appears on the display (divided 6 to each page):

```

CH001 CH002 CH003 CH004 CH005 CH006
[ 0 ]    0      0      0      0      0

```

By means of the universal faders, the levels (from 0 to 255) can be assigned, while by means of the light grey universal buttons it's possible to assign a clear-cut "ON" (level 255) or "OFF" (level 0) to the individual channels.

The Multifunction Keyboard is used to select the SCENE to be created or modified and storage is automatic.

Proceed in the same way for each SCENE required.

The SCENE is deleted by pressing the Reset button.

When this procedure is finished, press the left-hand scroll button to return to the Edit Menu.

5.2.2 - SCENE Time

This menu is used to set the running time for each SCENE in a Chase.

Scrolling with the up/down cursor arrows, the following appears on the display:

```

                EDIT MENU          esc<-
            [STEP'S TIME          ]    ok->

```

Pressing OK (right-hand Scroll button) gives access to the menu for setting the times.

```

CHASE STEP CROSS% TIME    ok->
- 1-  [ 1]   50    20

```

This will appear:

At this point, operators can set each SCENE's duration time (Time) and fade-up time (Cross%), expressed as a percentage variation of Time (see 3.3).

If it's necessary to set several SCENES simultaneously with the same parameters, GROUP OF SCENES

can be used: pressing and keeping it pressed, the following appears on the display:

```
select other steps to make a group
- 1- [ 1] 50 20
```

, then press the keys of the

SCENES required on the Multifunction Keyboard (for example) the following

```
PROG STEP CROSS% TIME
- 1- [GR] *** ***      ok->
```

appears: . The three asterisks indicate that the operator hasn't yet set a new value, which will replace them as soon as the corresponding universal fader is moved.

5.3 - Creating a Mchase

As already mentioned (see 3.4), NAVIGATOR 2000 has 40 Mchases.

As with the Programs and Chases, it must always be remembered that modifying a Mchase used by several Memories is equivalent to modifying all the Memories that contain it.

After having pressed the button, the following message appears on the display:

```
----- SELECT PSYCHOS -----
```

To create or modify a Mchase, press the relative key on the Multifunction

Keyboard (for example), then press to access editing mode.

When several Mchases are selected (max. 4), the flashing LED indicates which is being created or

modified ().

Pressing again aborts creation/modification and after exiting the procedure, the following appears:

```
PSY 01 will be UPDATED !      back<-
Press ENTER to store          <ESC>
```

Pressing the button, the variations made will be stored definitively, pressing the light grey universal button corresponding to ESC on the display, Edit is aborted without modifying the Mchase, pressing Back (left-hand scroll) returns to the Edit stage.

5.3.1 - Editing Mchases

The green LED corresponding to Mchase being created/modified lights up on the Multifunction

Keyboard: 

The level of each dimmer channel (divided into 6 per page) is shown on the display:

. The universal faders are used to assign the levels (from 0 to 255), whereas the light grey universal buttons indicated in the figure are used to select the audio frequencies to which the channels are to be assigned:

where NNNN stands for Low, Mid-Low, Mid-High and High.
The level of the channels is handled independently for each audio band. As already seen with mixing techniques, the highest level takes precedence on output (see 3.1.1.1), according to the following table:

Low Band	channel 001	level 155
Mid-Low Band	channel 001	level 180
Mid-High Band	channel 001	level 200
High Band	channel 001	level 100
<hr/>		
Output	channel 001	level 200

When these operations have been carried out, press  to save modifications and leave the function.

5.4 - Creating a Preset

As already mentioned (see 3.5), NAVIGATOR 2000 has 40 Presets, each with a maximum of 40 SCENEs. It's

therefore possible to create Scenes of lights using the dimmer channels (max 192 - see 3.5 and 4.2) of which any 4 can be enabled simultaneously. As with Programs, Chases and Mchases, it must always be remembered that modifying a Preset used by several Memories is equivalent to modifying all the Memories that contain it.

After having pressed the , button, the following message appears on the display

----- SELECT PRESET -----

To create or modify a Preset, press the relative key on the Multifunction

Keyboard (for example ) , then press  to access editing.

When several Presets are selected (max. 4), the flashing LED indicates which is being created or

modified ().

Pressing  again, creation/modification is aborted and when left, the following appears on the display

PRE 01 will be UPDATED ! back<-
Press ENTER to store <ESC>

Pressing the  button, variations made will be stored definitively, pressing the light grey universal button corresponding to ESC on the display, Edit is aborted without modifying the Preset, pressing Back (left-hand scroll) returns to the Edit stage.

5.4.1 - Editing Presets

The green LED corresponding to the Preset being created/modified lights up on the Multifunction

Keyboard:

The level of each dimmer channel (divided into 6 per page) is shown on the display:

CH001 CH002 CH003 CH004 CH005 CH006
[0] 0 0 0 0 0

. The universal faders are

used to assign the levels (from 0 to 255), whereas the light grey universal buttons are used  to set the values 0 or 255 directly. When these operations have been carried out, press to store modifications and leave the function.

6 - Advanced use of the NAVIGATOR 2000

In this section, some easy ways for increasing the possibilities offered by the NAVIGATOR 2000 are described.

6.1 - Multiple FIXTUREs

NEVER try to create new FIXTUREs or multiple FIXTUREs without first having all the data regarding the FIXTUREs to be created or modified!

As has already been seen, each NAVIGATOR 2000 can control 40 Fixtures, each using up to 36 channels.

There are at present no intelligent Fixtures on the market requiring this number of channels: the YPL Galileo IV Live 1200 (at present the most powerful in the YPL range) in fact only uses 18. Considering that the board operates on all 512 DMX channels, it's possible to exploit the 36 channels available by creating Multiple FIXTUREs, i.e. "FIXTUREs made up of more than one Fixture". This programming must be carried out carefully, particularly when setting the Fixtures' addresses. To give a practical example: we've 15 YPL Flasher DMX 1.5 FIXTUREs at our disposal to enter among the FIXTUREs already available.

Using the normal method, 15 of 40 FIXTUREs available will be used for control, but (by analysing the

Flashers) it can be seen that they only use 2 channels, for the dimmer and flash rate respectively. It's therefore possible to create a multiple FIXTURE made up of all 15 Fixtures, but in this case, the

assignment of the addresses to be set on the Fixtures must be in rising order, starting with the first Fixture and addressing them as follows:

- Flasher #1	001	- Flasher #2	003	- Flasher #3	005
- Flasher #4	007	- Flasher #5	009	- Flasher #6	011
- Flasher #7	013	- Flasher #8	015	- Flasher #9	017
- Flasher #10	019	- Flasher #11	021	- Flasher #12	023
- Flasher #13	025	- Flasher #15	027		

In the following example, the effects of the 15 Fixtures will be set to run in sequence.

We can therefore create a new "Super Flasher" FIXTURE, setting the parameters in this way (for a detailed description, see chapter 4 and sub-chapters):

* Channels used:

```
Total channels occupied on DMX      esc<-
NNNNNNNNNNNNNNNNNNNNNNNNNNNNNN  [30]      ok->
```

*Description of the commands on the Pilot display:

```
Enter the string for effects      more<->
DIM01 RAT01 DIM02 RAT02 DIM03 RAT03  P1
```

```
Enter the string for effects      more<->
DIM04 RAT04 DIM05 RAT05 DIM06 RAT06  P2
```

Enter the string for effects							more<->
DIM07	RAT07	DIM08	RAT08	DIM09	RAT09	P3	

Enter the string for effects							more<->
DIM10	RAT10	DIM11	RAT11	DIM12	RAT12	P4	

Enter the string for effects							more<->
DIM13	RAT13	DIM14	RAT14	DIM15	RAT15	P5	

• Allocation of control channels:

DIM01	RAT01	DIM02	RAT02	DIM03	RAT03	<->	
[1]	2	3	4	5	6	P1	

DIM04	RAT04	DIM05	RAT05	DIM06	RAT06	<->	
[7]	8	9	10	11	12	P2	

DIM07	RAT07	DIM08	RAT08	DIM09	RAT09	<->	
[13]	14	15	16	17	18	P3	

DIM10	RAT10	DIM11	RAT11	DIM12	RAT12	<->	
[19]	20	21	22	23	24	P4	

DIM13	RAT13	DIM14	RAT14	DIM15	RAT15	<->	
[25]	26	27	28	29	30	P5	

• Allocation of control channels:

DIM01	RAT01	DIM02	RAT02	DIM03	RAT03	<->	
[000]	000	000	000	000	000	P1	

DIM04	RAT04	DIM05	RAT05	DIM06	RAT06	<->	
[000]	000	000	000	000	000	P2	

DIM07	RAT07	DIM08	RAT08	DIM09	RAT09	<->	
[000]	000	000	000	000	000	P3	

DIM10	RAT10	DIM11	RAT11	DIM12	RAT12	<->	
[000]	000	000	000	000	000	P4	

DIM13	RAT13	DIM14	RAT14	DIM15	RAT15	<->	
[000]	000	000	000	000	000	P5	

• Setting for standby parameters:

DIM01	RAT01	DIM02	RAT02	DIM03	RAT03	<->	
[DIM]	EFF	DIM	EFF	DIM	EFF	P1	

```
DIM04 RAT04 DIM05 RAT05 DIM06 RAT06 <->
[DIM] EFF DIM EFF DIM EFF P2
```

```
DIM07 RAT07 DIM08 RAT08 DIM09 RAT09 <->
[DIM] EFF DIM EFF DIM EFF P3
```

```
DIM10 RAT10 DIM11 RAT11 DIM12 RAT12 <->
[DIM] EFF DIM EFF DIM EFF P4
```

```
DIM13 RAT13 DIM14 RAT14 DIM15 RAT15 <->
[DIM] EFF DIM EFF DIM EFF P5
```

Setting for Mirror/Head (the Fixture has no moving parts):

```
X(PAN)      | Y(TILT)      | OUTPUT      ok->
H[---]L --- | H --- L --- | MIRROR/HEAD
```

Setting for Slope Speed, bearing in mind that both the dimmer and the Flasher DMX 1.5 flash rate have linear regulation:

```
DIM01 RAT01 DIM02 RAT02 DIM03 RAT03 <->
[SOFT] SOFT SOFT SOFT SOFT SOFT P1
```

```
DIM04 RAT04 DIM05 RAT05 DIM06 RAT06 <->
[SOFT] SOFT SOFT SOFT SOFT SOFT P2
```

```
DIM07 RAT07 DIM08 RAT08 DIM09 RAT09 <->
[SOFT] SOFT SOFT SOFT SOFT SOFT P3
```

```
DIM10 RAT10 DIM11 RAT11 DIM12 RAT12 <->
[SOFT] SOFT SOFT SOFT SOFT SOFT P4
```

```
DIM13 RAT13 DIM14 RAT14 DIM15 RAT15 <->
[SOFT] SOFT SOFT SOFT SOFT SOFT P5
```

- Setting for the new Fixture's name:

```
ENTER/MODIFY THE NAME OF THE UNIT
-SuperFlasher-
```

- Setting for Remote Reset and lamp ignition (not available on the Flasher):

```
RESET  OFF  ON  | LAMP  OFF  ON
[---]  ---  ---  |  ---  ---  ---  ok->
```

- Definition of the setting modes, i.e. the way in which the start address has to be calculated. On a Flasher DMX 1.5, the setting is done using rotary switches that indicate the address in decimal numbers, so this setting is useless:

```
ENTER THE DIP-SWITCH CONFIGURATION
n.dip=[---] 1st channel= - ok->
```

- Setting Beam Find values, of no use with this FIXTURE:

```
DIM01 RAT01 DIM02 RAT02 DIM03 RAT03 <->
[ --] -- -- -- -- -- P1
```

```
DIM04 RAT04 DIM05 RAT05 DIM06 RAT06 <->
[ --] -- -- -- -- -- P2
```

```
DIM07 RAT07 DIM08 RAT08 DIM09 RAT09 <->
[ --] -- -- -- -- -- P3
```

```
DIM10 RAT10 DIM11 RAT11 DIM12 RAT12 <->
[ --] -- -- -- -- -- P4
```

```
DIM13 RAT13 DIM14 RAT14 DIM15 RAT15 <->
[ --] -- -- -- -- -- P5
```

- Setting the control of the parameters for the channels (Linear or Tabular), in which there is only the Linear value, as the two channels have continuous regulation:

```
DIM01 RAT01 DIM02 RAT02 DIM03 RAT03 <->
[LIN] LIN LIN LIN LIN LIN P1
```

```
DIM04 RAT04 DIM05 RAT05 DIM06 RAT06 <->
[LIN] LIN LIN LIN LIN LIN P2
```

```
DIM07 RAT07 DIM08 RAT08 DIM09 RAT09 <->
[LIN] LIN LIN LIN LIN LIN P3
```

```
DIM10 RAT10 DIM11 RAT11 DIM12 RAT12 <->
[LIN] LIN LIN LIN LIN LIN P4
```

```
DIM13 RAT13 DIM14 RAT14 DIM15 RAT15 <->
[LIN] LIN LIN LIN LIN LIN P5
```

This setting finishes the procedure for creating multiple FIXTUREs.

Working in this way operators can also create multiple colourchangers, for example by setting 5 YPL Colorbasic 250 Fixtures (which require 5 channels each) as a single FIXTURE. In this case, addressing must be in blocks of five.

6.2 - Multiple scanner FIXTUREs

Scanners (or moving head Fixtures) have 4 channels reserved for control of the moving parts (see parag. 8.5.1.6).

When creating a multiple FIXTURE, it's impossible to assign more than one channel to movement controls (joystick and cursor), due to the complexity of this type of control.

It's therefore inadvisable to create multiple scanner FIXTUREs, unless they're extremely simple FIXTUREs

(requiring few control channels), in which case it's possible (setting 8-bit mirror movement on the Fixture) to "make do" by moving the mirror using two faders for Pan and Tilt.

In this case, it's more practical to use these FIXTUREs as "extra FIXTUREs" and only control them using programs.

To create a multiple scanner set-up, the same logic is used as in parag. 6.1 , taking into consideration this possible effects string:

```
Enter the string for effects more<->
PAN*01*TILT DIMM SHUT GOBO COLOR P1
```

Here again, as Pan and Tilt aren't assigned to the joystick, but to two faders, nothing will be entered in the page regarding Mirror/Head settings.

7 - Using the connectors

7.2 – Pedal

A twin pedal can be connected to the appropriate connector on the rear. This remote control allows operators to run through the memories, leaving their hands free for other work. Intended particularly for groups or operators working in theatres who have to synchronize a Scene change with the beginning of a piece of music, this doesn't require any further equipment. Refer to page 6 for the connection diagram.

The functions available are:

- UP without Record enabled – enables Record register 1.
- UP with a Record enabled – SCENEs forward 1 position in the memories (from 1 to 2).
- DOWN with a Record enabled – SCENEs back 1 position in the memories (from 2 to 1).
- DOWN with no memories enabled – enables Record register 40
- UP and DOWN simultaneously with Record enabled – switches the Record off.

7.2 – SMPTE socket

This socket is used to connect the board to a sync time code source, which can be used to record a series of events which must take place at a precise moment.

This signal is generally used in broadcasting (television productions). It's only an input: the NAVIGATOR 2000 doesn't generate a signal for external use.

The SMPTE signal is normally obtained using the MIDI Time Code (from a sequencer, for example) and converting it with one of the numerous devices available for this purpose.

7.3 – MIDI connectors

By means of these connectors, which use a protocol recognized throughout the world, it's possible to carry out various operations, the most important of which are:

linking several NAVIGATOR 2000 to increase the FIXTUREs and programs available (Master/Slave connection);

- connecting a NAVIGATOR 2000 for use as a 'slave' of a master keyboard or sequencer

When several boards are connected in a MIDI chain, the DMX signals aren't summed: each board must be connected to the relative DMX chain.

The dipswitch on the rear of the board allows to select the MIDI channel on which signals sent to the board are received (the MIDI channels have a range of 1 - 16). Commands are only transmitted by the board on channel 1.

The NAVIGATOR 2000's software doesn't take into consideration values not within the range required for each function.

The possibility of transmitting MIDI data to other NAVIGATOR 2000 boards can be used to control other

devices using this 'language'. If a sequencer or master keyboard (enabled to receive on channel 1) has to work in sync with the lights, when a Record is enabled the relative Program Change is also sent, so the two events take place simultaneously.

7.3.1 - Midi IN - Note On

This command is used to switch on one or more of the first 128 channels using the MIDI "Note On" command and treating the channel like a key on a piano keyboard. It's therefore virtually possible to "play" the light channels.

The range of values must be between 0 and 127.

If the device transmitting the MIDI signals is fitted with Velocity control, the channel is switched on at the level indicated by Velocity, if not, it's simply switched on.

7.3.2 - Midi IN - Note Off

This command allows to switch off one or more of the first 128 channels using the MIDI "Note Off" command.

The range of values must be between 0 and 127. Values not included in this range are automatically ignored.

7.3.3 - Midi IN - Program Change

This MIDI function allows to change the presets a FIXTURE has.

On NAVIGATOR 2000 boards, transmitting this data allows to pass from one Record to another. The range of parameters must be between 0 and 39.

In MIDI numeration, 0 stands for 1, so the correspondence is as follows: 0=1, 1=2, 2=3, 3=4, 4=5, 5=6, 6=7, 7=8, 8=9... 39=40.

The transmission of one of the above values switches the Record on and transmitting the same value again switches it off.

7.3.4 - MIDI IN - All channels Off

In MIDI, this command is part of the vast Control Change series (followed by hexadecimal codes 7Bh and 0h) and results in all the channels that were previously on being switched off.

7.3.5 - MIDI OUT - Program Change

As seen at 9.3.3 (MIDI IN), if for example another Pilot board is connected to the one being used, this allows to send the command for changing the Record.

The patch of the NAVIGATOR 2000 that receives this command must always be set at Channel 1.

7.4 – RS-232 connections

Using a standard DB-9 connector, by means of this connection it's possible to connect a Pilot 2000 board to a personal computer.

It's therefore possible to carry out several functions:

- updating the board's firmware
- remote control of the board.

One PC can control up to 16 NAVIGATOR 2000 boards, each with its patch set using the dipswitch loca-ted on the rear of the board.

The protocol used is RS-232, which is a 2-way serial data transmission system and therefore only requires one connector. The command format includes the command and one or two numbers between 0 and 127.

Always remember that numeration starts at 0, whereas counting normally starts at 1. This means that if data has to be transmitted to channel 1, it must actually be transmitted to channel 0.

7.4.1 - RS-232 - Channel On (A1h)

This command allows to switch a channel on at a certain level.

The command syntax is as follows: CH_ON,n,x

where n is the number of the channel and x the value to be set.

If the value transmitted is not between 0 and 127, it's ignored.

Example: switch on channel 4 at 50% = CH_ON,3,64

7.4.2 - RS-232 - Channel Off (A2h)

This command is used to switch off a channel.

The command syntax is as follows: CH_OFF,n
where n is the channel number.

Example: switch off channel 4 = CH_OFF,3.

7.4.3 - RS-232 - All Off (A3h)

This command allows to switch off all channels previously switched on with the Channel On command. There's no operator.

The command syntax is as follows: ALL_OFF

Example: switch off the channels = ALL_OFF.

7.4.4 - RS-232 - Register Change (A0h)

This command is used to pass from one Record register to another.

The command syntax is as follows: REG_CHG,n
where n is the number of the register to be switched on.

Example: switch on register 24 = REG_CHG,23.

If this command is given when the register is already on, the register in question is switched off.

7.4.5 - RS-232 - Device Select (A6h)

This command is used to select which one of the 16 NAVIGATOR 2000 boards which can be controlled

has to receive the commands.

Setting is carried out on the board's rear panel, using the relative dipswitch.

The command syntax is as follows: DEV_SEL,n

where n is the identification number of the board to be controlled.

Example: select board 3 = DEV_SEL,2.

8 - Using 'Event Recording'

NAVIGATOR 2000 boards are able to record 20 sequences of events and reproduce them.

In order to do this, a time code is required for sync purposes: for this reason, NAVIGATOR 2000 boards

are fitted with a socket for connection to an SMPTE signal generator.

This type of signal is used worldwide, mainly in the (television) broadcasting sector. When an SMPTE signal isn't available, the board generates a similar signal internally and uses it for sync. The only events which can be recorded are Record changes.

Procedure for event storage records each action at the moment in which it is carried out.

The board's available Record limit isn't based on time, but quantity: up to 24,576 events can in fact be recorded and run in the course of an entire day.

Operators are free to operate manually on all the board's sections while events are running.

8.1 - Creating a track

No matter what operating mode they are to be run in, tracks are created using the same criterion.

By pressing and holding down the buttons for at least 4 seconds, use the Record register buttons to select the 'track' to be recorded.

During the selection phase, the ENTER and PLAY buttons' LEDs will be lit, then ENTER will start

to flash and will continue flashing throughout recording. Recording begins when the button  of the required tracks is pressed.

It's only possible to record crossovers between the Memories.

There's no way of changing a parameter in the track: if operators make a mistake, they must start again from the beginning.

8.2 - Replaying a track

To replay a recorded track, no matter in what operating mode it's to be run in, press the PLAY button and hold it down, then (using the Record buttons) select the required 'track'.

9 - Quick reference

This section is a brief summary of up the function buttons on the NAVIGATOR 2000 and their applications.

NAVIGATOR 2000 has a general output level control, by means of which the overall level of all the "dimmer" channels is regulated (both of the conventional type and those of intelligent FIXTUREs). The value is expressed as a percentage, ranging from 0 to 100%

This function gives access to the Setup Menu, by means of which the FIXTUREs are patched and libraries controlled. See chapter 4 for this function's details.

The Copy function allows operators to copy the elements making up the Record Objects, obtaining new elements that are identical to the original ones. When copy is enabled, the relative LED flashes.

The Enter button is used by some functions to confirm the decision to modify elements or store new elements.

The Play function allows to run one of the 20 tracks of recorded "events". See chapter 8 for details.

NAVIGATOR 2000 has the possibility of recording 20 sequences of events and playing them back. Pressing and holding down these buttons simultaneously for at least 4 seconds starts the recording process. See chapter 8 for further details.

NAVIGATOR 2000 allows a maximum of 48 channels to be reserved for particular FIXTUREs or functions.

This function allows to define the DMX channels corresponding to the "extras", i.e. those FIXTUREs (normally smoke machines or strobe lights) which operators control directly (without

going through Record and Program).

By means of this control, it's possible to send lamp on/off commands (to Fixtures on which these functions are enabled). When the Pilot is switched on, default status is with the lamp on.

By means of this control, it's possible to send lamp on/off commands for resetting the electronics (to Fixtures on which these functions are enabled). It's a type of direct operation which operators carry out on the FIXTURES controlled

NAVIGATOR 2000 has two pages for Records, Programs, Chases, Mchases, Presets, FIXTURES and

SCENEs. When the button's LED is off, page 1 is enabled (selections 1 - 20), whereas when it's lit,

page 2 is enabled (selections 21 - 40).

The Hold function allows to store the elements created in the programs.

Hold also allows to make a copy of the Record. For example, if it's necessary to copy the contents of Record N° 1 to N° 2, first select the "source" Record then, pressing and holding down Hold, select the "target". Also used to confirm any modifications or additions to a Record

This control gives access to the section for creating and modifying Programs, Chases, Mchases and Presets. When Edit è enabled, the relative LED flashes.

This function allows to choose the general level of a Preset, Chase, Program and Mchase. The function operates simultaneously (but individually) on all 4 types of programs assigned to a Record.

This function allows to set fade-in and fade-out times for Presets and Mchases and to time Programs and Chases.

The time can be set at between 0 and 999 tenths of a second (600 tenths of a second correspond to a minute).

NAVIGATOR 2000 has 40 Memories, which operate in over-riding mode.

Therefore, only one Record can be enabled at a time. Each Record can control a maximum of 4 Programs, 4 Chases, 4 Mchases and 4 Presets simultaneously. The control is used to select the Record to be created, modified or run.

NAVIGATOR 2000 has 40 Programs, of which any 4 can run simultaneously in a Record.

The maximum number of Scenes (SCENEs) able to be run is 40 for each program, with the possibility of

controlling up to 40 motorized Fixtures. This control is used to select the program to be created, modified or run.

192 channels (of the total of 512) can be reserved for controlling dimmer channels. These 192 channels can be animated using the Chases: on/off sequences programmed by the operator. 40 Chases are available, each made up of a maximum of 40 SCENEs. This control is used to select the Chase to be created, modified or run.

mchase

The 192 dimmer channels can also be switched on and off in time with the music, with the sync latched to 4 audio bands (Low, Mid-Low, Mid-High, High). NAVIGATOR 2000 has 40 Mchase set-ups that can be programmed by operators. This control is used to select the Mchase to be created, modified or run.

This function also uses the 192 dimmer channels available on the NAVIGATOR 2000, which in this case will be used to create fixed lighting Scenes. The 40 available Presets are programmable by operators. For each of these, it's possible to assign the level of each single channel used; the general level of the entire Preset (Level, from 0 to 100%) and fade-in/fade-out times of the entire Preset (Times, from 0 to 999 tenths of a second). This control is used to select the Preset to be created, modified or run.

scene

The maximum number of SCENE available for a single Program or Chase is 40; the SCENE which is to be created or modified is selected by using this control.

multifunction keyboard This zone can be identified by the 20 dark grey buttons and the white printing and is located at the bottom of the NAVIGATOR 2000's front panel. Its use is closely linked with the section containing the keys: Record, Program, Chase, Mchase, Preset, FIXTURE, SCENE; in fact, pressing one of these sets the keyboard in the mode relative to the button pressed. For example, if the Record button is pressed, using the Multifunction keyboard it will be possible to select one of the 40 memories available; the same holds for the other keys. Moreover, it also allows to control lamp ignition and to reset the FIXTUREs when the Lamp and Reset buttons are selected.

Lastly, it's important to underline the fact that the button Page doubles the keyboard's selection possibility from 20 to 40 keys.

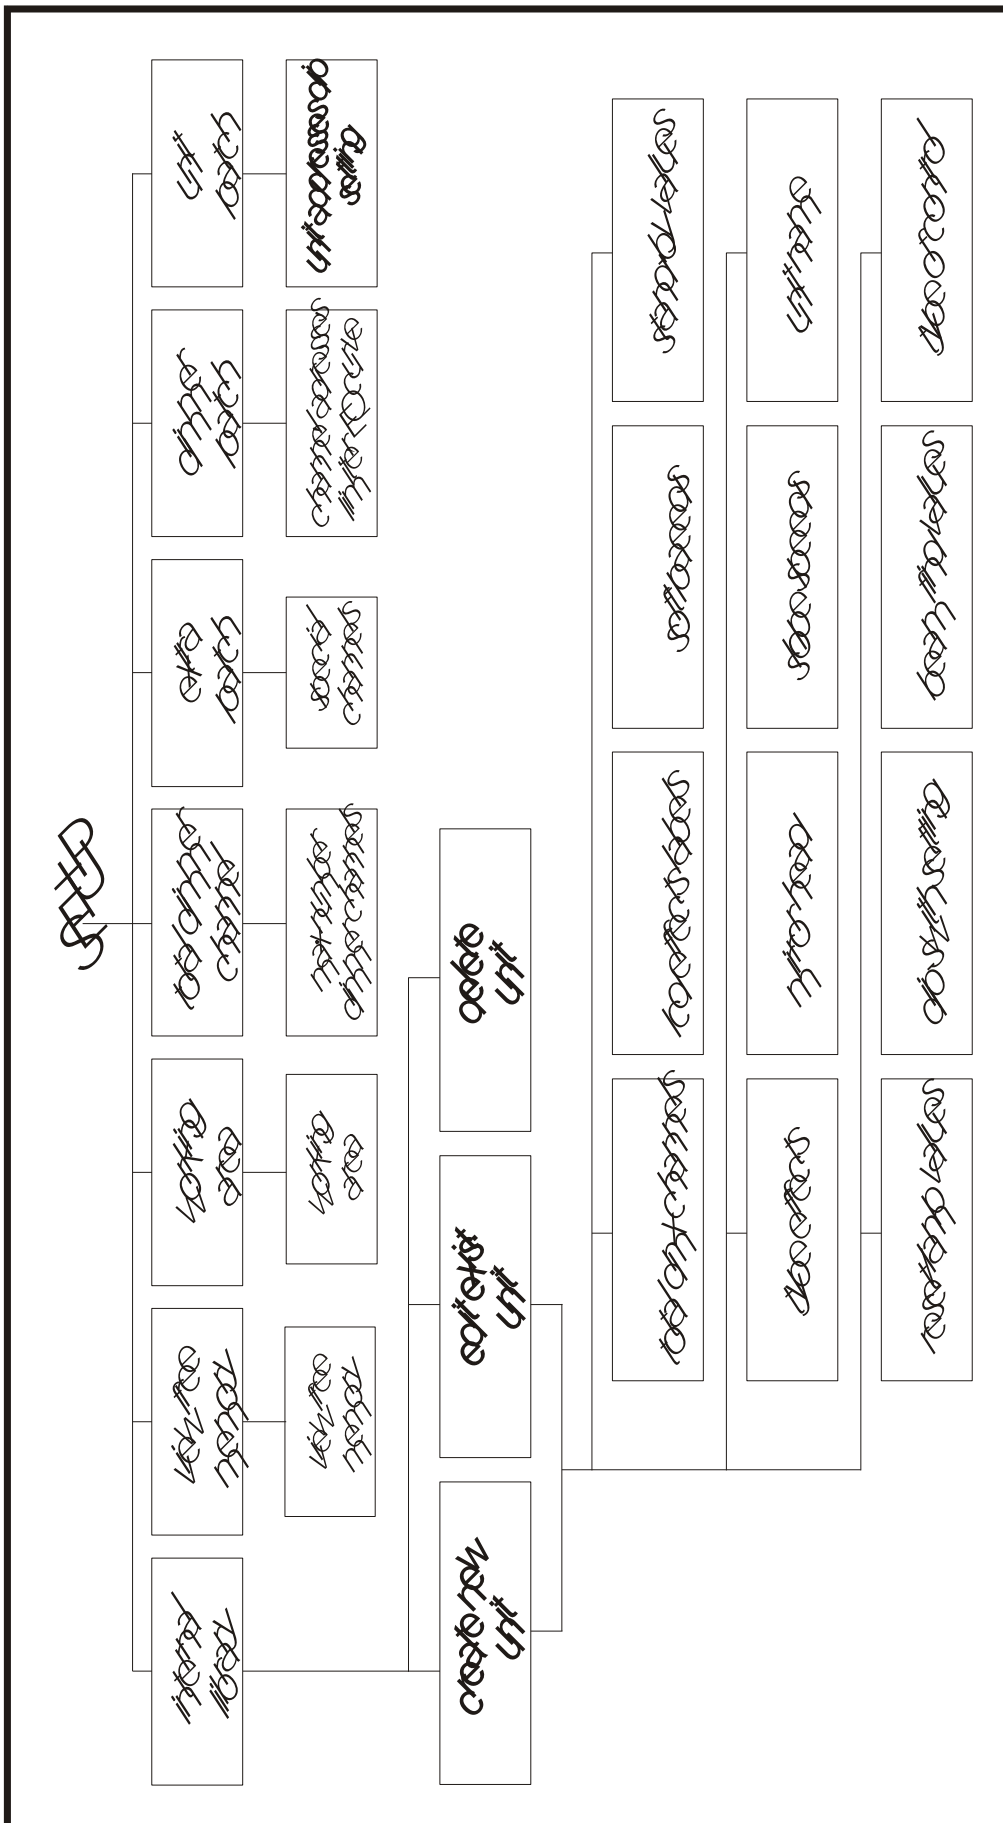

fixture

NAVIGATOR 2000 allows to control a maximum of 40 FIXTUREs. A FIXTURE is intended as being any moto-rized Fixture whose various functions (channels) can be controlled using a digital signal called DMX. A maximum of 36 channels can be configured for each FIXTURE. This control can be used to select the FIXTURE to be used manually or in a program.

multifunction keyboard

9.1 - Tree-structure diagram of Setup functions

The following pages contain the sequences of commands to be carried out to obtain a certain situation.

The following three symbols conventionally indicate the buttons LED's status

as off () , lit () or flashing () .

10.1 - Changing page

1 - Press the  button .

There are 2 pages available: if the button's LED is off, the selection of keys 1-20 is enabled; if the button's LED is lit, the selection of keys 21-40 is enabled. The page change can be in any selection.

10.2 - Selecting a Record

1 - Press the  button..

2 - Press the button (from 1 to 20) corresponding to the Program to be selected for creation or modification.

10.3 - Selecting a Program

1 - Press the  button .

2 - Press the button (from 1 to 20) corresponding to the Chase to be selected for creation or modification.

10.4 - Selecting a Chase

1 - Press the  button.

2 - Press the button (from 1 to 20) corresponding to the Chase to be selected for creation or modification.

10.5 - Selecting a Mchase

1 - Press the  button.

2 - Press the button (from 1 to 20) corresponding to the Mchase to be selected for creation or modification.

10.6 - Selecting a Preset

1 - Press the  button..

2 - Press the button (from 1 to 20) corresponding to the Preset to be selected for creation or modification.

10.7 - Selecting a FIXTURE

- 1 - Press the  button .
- 2 - Press the button (from 1 to 20) corresponding to the FIXTURE to be selected for manual control or positioning in a Program.

10.8 - Groups of FIXTURES

NAVIGATOR 2000 allows to control 6 groups of FIXTURES that can be stored and recalled using the 6 light grey buttons under the 6 multifunction faders.

10.8.1 - Creating Groups of FIXTURES

- 1 - Press and hold down the  button..
- 2 - The following will appear on the display

```
select other units to make a group
GRP1  GRP2  GRP3  GRP4  GRP5  GRP6
```

- 3 - Using the 6 light grey buttons under the 6 multifunction faders, select the group required.
- 4 - By means of the **multifunction keyboard** select the FIXTURES to be included in the group.

- 5 - Release the  button. The Group of FIXTURES is stored automatically.

10.8.2 - Eliminating a FIXTURE from a Group

The **multifunction keyboard** indicates the FIXTURES used in the following way:

LED off means that there are no FIXTURES in the group;

LED lit means there are FIXTURES in the patch of the NAVIGATOR 2000;

flashing LED shows the FIXTURES in the group.

To eliminate a FIXTURE from a group, just switch off the LED of the button corresponding to the FIXTURE

which is not required when selecting the group.

10.8.3 - Recalling a Group of FIXTURES

- 1 - Press the  button and hold it down.
- 2 - Press the light grey multifunction button corresponding to the group required

3 - Release the button..

10.9 - Creating a Preset

1 - Select one of the 40 Memories.

2 - Press the button.

3 - Press the **multifunction keyboard** key corresponding to the Preset to be created

4 - Press the button (the LED of the Edit button will flash and the LED of the Preset button will remain lit).

5 - Set the levels required per each channel using the 6 universal faders.

6 - Press the button.

7 - Press the button to confirm creation or modification.

10.10 - Creating a Mchase

1 - Select one of the 40 Memories.

2 - Press the button.

3 - Press the **multifunction keyboard** key corresponding to the Mchase to be created.

4 - Press the button (the LED of the Edit button flashes and the LED of the Mchase button remains lit).

5 - Using the first four light grey multifunction buttons, select the required audio band (from left to right: LOW, MID LOW, MID HIGH, HIGH)

--- YOU MUST SELECT A RECORD ---

6 - Set the levels required per each channel using the universal faders.

7 - Press the  button.

8 - Press the  button to confirm creation or modification.

10.11 - Creating a Chase

1 - Select one of the 40 Memories.

2 - Press the  button.

3 - Press the  key corresponding to the Chase to be created.

4 - Press the  button (the LED of the Edit button will flash, whereas the LED of the Chase button will remain lit).

5 - The display will show the Chase selected with the number of any SCENEs already created (LENGTH). If no SCENEs have already been created, two dashes will appear below the LENGTH field.

6 - Press the right-hand scroll button  to enter the Chase Edit Menu.

7 - Use the up/down arrows  to select the Edit SCENEs Menu.

8 - Confirm the choice pressing the right-hand button .

9 - At this point, the LEDs of the  and  keys will start flashing.

10 - Use the 6 universal faders to set the levels required for each channel.

11 - Select the new SCENE of the Chase to be created, pressing the button of the Multifunction Keyboard corresponding to the required SCENE. The settings created at point 9 will be automatically stored.

12 - Repeat points 9 and 10 to store other SCENEs.

13 - Once SCENE creation procedure is finished, press the left-hand scroll button twice

14 - The following screen will appear:

```
CHASE LENGTH          esc<-
01  [40]              edit->
```

15 - Modify the LENGTH field (total number of SCENEs programmed) according to the number of SCENEs created using the up/down keys .

16 - Press the  button.

17 - Press the  button to confirm creation or modification.

10.12 - Modifying Chase SCENE times

1 - Select the Chase whose setting have to be changed.

2 - Press the  button.

3 - Press the right-hand scroll key  to access the Chase Edit Menu.

4 - With the up/down arrows  select the SCENE's Time Menu.

5 - Confirm the choice pressing the right-hand scroll button .

6 - The following screen appears:

```
CHASE STEP CROSS% TIME  ok->
- 1-  [ 1]   50   20
```

Here operators can set the duration time (Time) and the running time (Cross%) of each SCENE, expressed as a percentage variation of Time. It must be remembered that the time can be adjusted between 0 and 999 tenths of a second (600 tenths of a second are equal to 1 minute).

7 - Press the  button.

8 - Press the  button to confirm modification.

10.13- Re-patching a dimmer channel

Assuming it's necessary to patch channel 12 of the manual section to DMX channel number 512 in On/Off mode:

1 - Press the  button.

2 - Scroll with the up/down arrows until "Dimmer Patch" appears on the display.

```

CONFIGURATION & SETUP MENU
SELECT --> [DIMMER PATCH]      ok->
    
```

3 - Press the right-hand Scroll button

4 - The following screen will appear:

```

DMX-CH  CHANNEL  LIM%  EQUAL  ok->
[001] <----  ---  ----  -  <DEL>
    
```

5 - Press the UP/DOWN button of the cursor to set the DMX channel with which the board's physical channel will be patched until the required channel appears:

```

DMX-CH  CHANNEL  LIM%  EQUAL  ok->
[512] <----  ---  ----  -  <DEL>
    
```

6 - Using the cursor Left/Right cursor, move below the "Channel" field and set the logic channel of the board which has to control channel 512 (if there were no preset values preset, selecting the logic channel automatically creates the LIM% and EQUAL "fields"):

```

DMX-CH  CHANNEL  LIM%  EQUAL  ok->
[512] <----  ---  ----  -  <DEL>
    
```

7 - Using the Left/Right cursor, move below the "Equal" field and set the equalization curve to be applied to channel 512:

```

DMX-CH  CHANNEL  LIM%  EQUAL  ok->
[512] <----  ---  ----  -  <DEL>
    
```

8 - Press  button to store the configuration and leave Setup.

10.14 - Patching FIXTURES

Assuming there is a Victory II 250 Fixture whose address starts with channel 50:

1 - Press the  button.

2 - Scroll with the up/down arrows until "FIXTURE Patch" appears on the display.

```

CONFIGURATION & SETUP MENU
SELECT --> [UNIT PATCH ]      ok->
  
```

3 - Press the right-hand Scroll button

4 - Press key  of the Multifunction Keyboard.

5 - The following will appear:

```

UNIT   TYPE      FROM  ---  1--cod--10
[ 1]-----<DEL>TO  ---  #####
  
```

6 - Press the right-hand button of the cursor to set the field to be changed:

7 - With the buttons Up/Down select the Victory 2:

```

UNIT   TYPE      FROM  ---  1--cod--10
[ 1] VICTORY 2    <DEL>TO  ---  #####
  
```

8 - With the Left/Right buttons select the From field (start address) and set the value

```

UNIT   TYPE      FROM  ---  1--cod--10
[ 1] VICTORY 2    <DEL>TO  ---  #####
  
```

required:

9 - Check the configuration of the dipswitches shown on the display and set it on the Fixture.

10 - Press the  button to store the configuration and leave Setup.

10.15 - Using a FIXTURE in manual

Assuming FIXTURE 1 (as set in paragraph 10.12) is to be controlled:

1 - Press the  button..

2 - Press the button  its LED will start to flash.

3 - Set the scanner's controls as required using the faders, checking the value of the command sent on the display:

10.16 - Creating a Program

Assuming program 1, made up of 1 Scene and using FIXTURE 1, has to be created:

1 - Select one of the 40 Memories.

2 - Press the button .

3 - Press the **multifunction keyboard** button corresponding to the Program which has to be created.

4 - Press the button  (the Edit button's LED will flash), whereas the Program button's LED will remain lit).

5 - Indication of the Program selected with the number of SCENEs (if any) already created (LENGTH) will appear on the display. If no SCENEs have already been created, two dashes will appear under the LENGTH field.

6 - Press the right-hand scroll button  to enter the Program's Edit Menu.

7 - Use the up/down arrows to select the Edit SCENEs Menu.

8 - Confirm the choice by pressing the right-hand scroll button

9 - At this point, the buttons' LEDs start flashing.

10- Set the scanner controls as required using the faders, checking the value of the command sent on the display.

11 - Press and hold down the Hold button, followed by button of the Multifunction keyboard cor-

responding to the SCENE to be stored:

12 - Should more SCENEs have to be created, all that's necessary is to modify the SCENE just stored

at point 10 and store it in another SCENE.

12 - Once SCENE creation procedure is finished, press the left-hand scroll

button twice

13 - The following appears:

14 - Modify the LENGTH field (number total of SCENEs programmed) according to the number of

SCENEs created using the up/down keys

15 - Press the button.

16 - Press the button to confirm creation or modification.

10.17 - Modifying the Program SCENE times

1 - Select the Program in which the settings have to be changed.

2 - Press the  button.

3 - Press the right-hand scroll button  to enter the Program's Edit Menu.

4 - With the up/down arrows , select the Menu called SCENE's Time.

5 - Confirm the choice by pressing the right-hand scroll button .

6 - This will appear:

PROG	STEP	CROSS%	TIME	ok->
- 1-	[1]	50	20	

Here (for each SCENE) operators can set the duration time (Time) and the running time (Cross%), expressed as a percentage variation of Time. It should be remembered that the time is can be set at between 0 and 999 tenths of a second (600 tenths of a second are equal to 1 minute).

7 - Press the  button.

8 - Press the  button to confirm modification.
